Supernatural perfection. See *perfection.* = **Syn. 1.** *Supernatural, Miraculous, Preternatural, Superhuman, Unnatural, Extra-natural.* That which is *supernatural* is above nature; that which is *preternatural* or *extra-natural* is outside of nature; that which is *unnatural* is contrary to nature, but not necessarily impossible. *Supernatural* is freely applicable to persons: as, *supernatural* visitants; *preternatural* sometimes; *unnatural* only in another sense. *Supernatural* is applied to beings, properties, powers, acts, in the realms of being recognized as higher than man's. In the following extract *supernatural* is used in the sense ordinarily expressed by *extra-natural* or *miraculous.*

That is *supernatural*, whatever it be, that is either not in the chain of natural cause and effect, or which acts on the chain of cause and effect, in nature, from without the chain. *H. Bushnell*, Nature and the Supernat., p. 37.

The raising of the dead to life would be *miraculous*, because, if brought about by a law of nature, it would be by a law outside of and above any that are known to man, and perhaps overruling some law or laws of nature. *Preternatural* is used especially to note that which might have been a work of nature, but is not. That which is *superhuman* is above the nature or powers of man. *Superhuman* is often used by hyperbole to note that which is very remarkable in man: as, he exhibited *superhuman* strength; the other words may be similarly used in a lower sense.

'a survival' (namely, of savage or barbarous beliefs generally outgrown) is modern, and is entirely foreign to Roman thought.] 1. = Syn. 1-3. *Superstition, Credulity, Fanaticism, Bigotry.* *Credulity* is a general readiness to believe what one is told, without sufficient evidence. *Superstition* may be the result of *credulity* in regard to religious beliefs or duties or as to the supernatural. As compared with *fanaticism* it is a state of fears on the one side and rigorous observances on the other, both proceeding from an oppression of the mind by its beliefs, while *fanaticism* is too highly wrought in its excitement for fear or for attention to details of conduct. *Fanaticism* is a half-crazy substitution of fancies for reason, primarily in the field of religion, but secondarily in politics, etc. *Fanaticism* is demonstrative, being often ready to undertake, in obedience to its supposed duty or call by special revelation, tasks that are commonly considered wicked or treated as criminal. *Bigotry* is less a matter of action: subjectively it is a blind refusal to entertain the idea of correctness or excellence in religious opinions or practices other than one's own; objectively it is an attitude matching such a state of mind. *Credulity* is opposed to *skepticism*, *superstition* to *irreverence*, *fanaticism* to *indifference*, *bigotry* to *latitudinarianism*. II. *n.* One who believes in supralapsarianism.

supralapsarianism (sū″prā-lap-sā'ri-an-izm), *n.* [< *supralapsarian* + *-ism*.] The theological doctrine that God selected from men to be created certain ones to be redeemed and receive eternal life, and certain others to be appointed to eternal death, and that thus, in the order of thought, election and reprobation preceded creation: so called because it supposes that men before the fall are the objects of election to eternal life and foreordination to eternal death.

It leaves the cranial cavity by the foramen rotundum of the sphenoid. (*b*) One of several small motor branches of the facial nerve, distributed to muscles of the superior maxillary region.

II. *n.*; pl. *supramaxillaries* (-riz). The superior maxillary, or upper jaw-bone, forming a part, in man nearly the whole, of the bony framework of the upper jaw, and representing more or less of the expanse of the cheek: correlated with *inframaxillary*. The part which the supramaxillary takes in the formation of the upper jaw mostly depends upon the relative size of the premaxillary (intermaxillary) bone. In man the latter is very small, occupying only a little space at the anterior-inferior corner of the supramaxillary, and is observable only in infancy, as it speedily ankyloses with the supramaxillary. The supramaxillary is in inverse ratio extensive, and also expansive or inflated, being entirely hollowed out by the maxillary sinus, or antrum of Highmore. It presents to the cheek an external or facial surface, with several elevations

Left Supramaxillary of Man, outer surface, about two thirds natural size.

m, three molars; *pm*, two premolars; *c*, canine; *i*, two incisors, rooted in alveolar border; *an*, anterior nasal spine; *nn*, nasal notch; *np*, nasal process; *os*, orbital surface; *ms*, rough surface for articulation with malar bone; *zs*, zygomatic surface; *pd*, two posterior dental canals; *so*, suborbital foramen; *if*, incisive fossa; *cf*, canine fossa. and depressions marking the attachments of muscles, and just below the eye the large infra-orbital foramen. The posterior or zygomatic surface shows the openings of the posterior dental canals, and a rough surface for articulation with the palate bone. The superior or orbital surface forms most of the floor of the orbit of the eye. The internal or nasal surface forms much of the outer wall of the nasal meatus, and shows the opening of the antrum. Besides these surfaces, the bone has several well-marked processes, as the nasal, running up to the frontal bone, the malar, articulating with the bone of that name, the alveolar, bearing teeth, and the palatal, roofing part of the mouth. The two supramaxillary bones when together show in front a somewhat heart-shaped opening, the anterior nares, at the middle of the base of which is the prominent nasal spine, a landmark in craniometry. Each articulates with nine bones (sometimes ten), and to each twelve muscles are attached. (See cuts under *skull*, *orbit*, and *palate*.) In other mammals the supramaxillary has various shapes, and is comparatively smaller; it may always be recognized as the bone which bears the upper molar, premolar, and canine teeth — all the upper teeth excepting the incisors. In birds the supramaxillary is very greatly reduced, and often not distinctly defined: the palatal part of it is represented by a well-developed maxillopalatine; but nearly the whole of the upper beak of a bird, beyond the feathers, has for its bony basis the highly developed premaxillary. In the lower vertebrates the superior maxillary is presented under the most diverse conditions of size and shape, and is generally identified with the second bone from the front of those constituting the upper maxillary arch.

surf[1] (sėrf), *n.* [An altered form (scarcely found before the 18th century, and prob. simulating *surge*) of *suff*[1] (early mod. E. *suffe*, Sc. *souf*), a phonetic spelling of *sough*, orig. a rushing sound: see *sough*[1]. The proposed derivation from OF. *surflot*, the rising of billow upon billow, is untenable. Cf. *surf*[2] for *sough*[2].] The swell of the sea which breaks upon the shore, or upon shoals: breakers. The breaking of surf is popularly but wrongly ascribed to friction with the bottom, whereby the upper part of the advancing wave is caused to fall forward: it is properly explained as the result of the increasing height of the advancing wave (this being due to the transmission of the wave energy through a shallowing body of water) and of the decreasing volume of water toward the shore with which the growing wave is to be built up: when the supply is insufficient, the wave-form cannot be propagated forward, and then the wave crest falls over.

=**Syn.** See *wave*[1].

surf[2] (sėrf), *n.* [An altered form of *suff*[2] for *sough*[2]: see *sough*[2]. Cf. *surf*[1] for *sough*[1].] The bottom or conduit of a drain. *Imp. Dict.*

The whole architecture of the house [in Pompeii] was coloured, but even this was not considered so important as the paintings which covered the flat *surfaces* of the walls. *J. Fergusson*, Hist. Arch., I. 370.

2. The boundary between two solid spaces not adjacent to a third: distinguished as a *mathematical surface*. A surface is a geometrical locus defined by a single general and continuous condition. This condition reduces the points of the surface to a two-dimensional continuum, its enveloping planes to a two-dimensional continuum, and its enveloping straight lines to a three-dimensional continuum. A ruled surface appears to be enveloped by a one-dimensional series of lines; but when imaginary points are considered, this is seen not to be so. A true one-dimensional continuum of lines requires for its determination a threefold condition, and can contain but a finite number (or discrete infinity) of points and of planes. The number of points or planes of a surface which satisfy a twofold additional condition, as that the points shall lie upon a given line, or that the planes shall contain a given line, and the number of lines of the surface which satisfy a threefold additional condition, as that they shall belong to a given plane pencil, are either finite or only discrete infinity. In the former case the surface is said to be *algebraical*, in the latter *transcendental*. If the imaginary elements are taken into account, the numbers are constant whatever the special lines or pencils to which they refer may be. The number of points of an algebraical surface which lie upon a given straight line is called the *order* of the surface; the number of tangent planes which contain a given line is called the *class* of the surface; and the number of tangent lines which belong to a given plane pencil is called the *rank* of the surface.

(*b*) The surface often originally, and better, called the *Roman surface* [discovered by Jacob *Steiner* (1796–1863), one of the greatest of geometricians], being a quartic surface of the third class, having three double lines. In its symmetrical form its appearance is thus described: Take a [regular] tetrahedron, and inscribe in each face a circle. There will be, of course, two circles touching at the mid-point of each edge of the tetrahedron; each circle will contain, on its circumference, at angular distances of 120°, three mid-points; and the lines joining these with the center of the tetrahedron, produced beyond the center, meet the opposite edges . . . joining the mid-points. . . . Now truncate the tetrahedron by planes parallel to the faces, so as to reduce the altitudes, each to three fourths of the original value; and from the center of each new face round off symmetrically up to the adjacent three circles; and within each circle scoop down to the center of the tetrahedron, the bounding surface of the excavation passing through [that is, containing] the three right lines, and the sections by planes parallel to the face being in the neighborhood of the face nearly circular, but, as they approach the center, assuming a trigoidal form, and being close to the center an indefinitely small equilateral triangle. We have thus the surface, consisting of four lobes united only by the lines through the mid-points of opposite edges—these lines being consequently nodal lines, the mid-points being pinch-points of the surface, and the faces singular planes, each touching the surface along the inscribed circle. It is worn at almost all offices except when replaced by the alb. In England it is also worn on certain days known as *surplice-days* by the fellows and students at the universities of Oxford and Cambridge. The surplice was originally a variety of the alb, differing from it by the greater fullness of the sleeves. Early representations of the alb show, however, that it was often nearly as full in shape as the surplice. The name *surplice* (*superpelliceum*) first occurs in the eleventh century, and was derived from the practice of wearing this vestment over a pelisse, or dress of fur—a circumstance which also explains its great breadth and fullness. In its more ancient form the surplice reached the feet, and it retained till recently nearly its full length. At present, in the Anglican Church, it reaches to the knee or lower, while in the Roman Catholic Church it is usually much shorter than this and is ornamented with lace or is made of lace-like lawn or other material. The short or Italian surplice, especially as worn by choristers, is called a *cotta.* See *rochet*[1].

In Brahmanic use, applied especially to collections of three classes: (1) *śrāuta-sūtras*, directions concerning the more elaborate and important ceremonies; (2) *grihya-sūtras*, concerning minor or household rites and practices; (3) *dharma-sūtras*, concerning the conduct of life, the duties of the castes, etc. The first two are reckoned as part of the Veda. suttee (su-tē'), *n.* [Also, better, *sati*; F. *suttie*, *suttee* (< E.), < Hind. *satī*, a faithful wife, esp. one who burns herself on the funeral pile of her husband; hence also the burning itself; Skt. *satī*, fem. of *sant*, existing, true, virtuous, abbr. from **asant*, ppr. of √ *as*, be, exist: see *am*, *is*, *sooth*.] 1. A Hindu widow who immolates herself on the funeral pile, either with the body of her husband, or separately if he died at a distance.—2. The voluntary self-immolation of Hindu widows on the funeral pile of their husbands according to a Brahmanical rite. The custom is not known or commanded in the most ancient sacred books of the Hindus, but is early spoken of as highly meritorious. The practice is now abolished in British India, and is all but extinct in the native states.

One of the first acts of the Dharmasabhâ was to petition Government against the abolition of *Suttee*—that is, in favour of the continuance of the burning of widows.

suttle[3] (sut'l), *a.* [Perhaps < It. *sotile*, *sottile*, fine, subtle: see *suttle*[1], now *subtle*.] Light; in the light weight previous to the additional goods delivered for tret. Since *tret* went out of use, very long ago, though continued in the arithmetic books, it has come to be wrongly stated to be a deduction, instead of an addition not to the number of pounds but to the amount of goods delivered; and *suttle* is sometimes erroneously called a noun.

At 16 pound the 100 *suttle*, what shall 895 pound *suttle* be worth, in giving 4 pound weight upon every 100 for treat. *Mellis*, Rules of Practice (before 1600), viii.

2. A line of joining, uniting, or closure as if by sewing, stitching, or knitting together; a seam; a raphe. Specifically—(*a*) In *anat.*, a linear synarthrosis or immovable articulation, especially of the bones of the skull. In man and other mammals all the cranial bones excepting the lower jaw are united by joints technically called sutures, and in all vertebrates which have bony skulls the sutures are numerous, uniting most of the bones. Sutures are classified or described in various ways: (1) by the mode of apposition of the united surfaces or edges of the bones, as the *squamous* suture, the *harmonic* suture, the *dentate*, the *limbate*, etc. (see *synarthrosis*); (2) by the shape or position of the suture, as the *coronal*, *sagittal*, *lambdoid* suture (many of these sutures appear in the cuts under *cranium* and *skull*, and in most of the other skulls figured in this dictionary); (3) by the names of the two bones which are sutured, as the *frontoparietal*, *occipitoparietal*, *sphenoparietal* suture. See phrases following. (*b*) In *entom.*, the line along which the elytra of opposite sides meet and sometimes are confluent. (*c*) In *conch.*, the line of junction of the successive whorls of a univalve shell, or the line of closure of the opposite valves of a bivalve shell. (*d*) In cephalopods, the outline of the septa of the tetrabranchiates, which resemble in some respects the dentate sutures of the cranial bones. These lines are variously traced in different cases; when they are folded the elevations or saliences are called *saddles*, and the intervening depressions or reëntrances are called *lobes*.

3. In *bot.*, the seam or line of junction between two edges, as between the component carpels of a pericarp, there commonly marking the line of dehiscence.—4. In *surg.*: (*a*) The uniting of the lips or edges of a wound by stitching or stitches, or in some equivalent manner. (*b*) One of the stitches or fastenings used to make such a union of the lips of a wound.

In adult man it is usually obliterated by confluence of the bones: when it persists, it continues the line of the sagittal suture down the middle of the forehead to the root of the nose. More accurately called *interfrontal suture*. (*b*) In *entom.*, same as *clypeal suture*.—**Frontoparietal suture**, the coronal suture.—**Frontosphenoidal suture**, the suture between the frontal and sphenoidal bones, chiefly the line of apposition of each orbital plate of the frontal with the corresponding orbitosphenoid.—**Genal suture.** See *genal*.—**Great suture.** Same as *genal suture*.—**Gular sutures.** Same as *buccal sutures*.—**Harmonic suture**, suture by means of flat rough surfaces apposed without beveling: a variety of false suture.—**Interfrontal suture**, the frontal suture.—**Intermaxillary suture**, the harmonic suture between the right and left superior maxillary bones, effected chiefly by their palatal plates and alveolar borders.—**Internasal suture**, the suture between the right and left nasal bones.—**Interparietal suture**, the sagittal suture.—**Lambdoid suture**, the occipitoparietal suture: so called because in man it presents the shape of the Greek capital letter lambda (Λ). Teut. **swalgwon,* perhaps = Gr. *ἀλκυών* (written also *ἀλκυών,* and erroneously associated with *ἅλς,* sea), a kingfisher: see *halcyon.*] **1.** A fissirostral oscine passerine bird with nine primaries; any member of the family *Hirundinidæ,* of which there are numerous genera and about 100 species, found in all parts of the world. The leading species of swallows are the barn-swallows of the genus *Hirundo,* with long deeply forked tail having the lateral feathers elongated and linear toward their ends, and with lustrous steel-blue plumage on the upper parts, and more or less rufous plumage below. The common bird of Europe is *H. rustica;* that of America is *H. erythrogastra.* They are called *barn-swallows* because they usually build their nests of straw and mud on the rafters of barns. The house-swallow or martin of Europe is *Chelidon urbica,* of a genus not represented in America. The purple martin of North America is a very large swallow, *Progne subis* or *P. purpurea,* the male of which is entirely lustrous steel-blue; several similar species of the same genus inhabit other parts of America. The most widely diffused species of the family is the bank-swallow or sand-martin, *Clivicola* or *Cotile riparia,* common to both hemispheres, of a mouse-gray and white coloration, without luster, breeding in holes in banks. Cliff-swallows are several species of the genus *Petrochelidon,* found in various parts of the world. That of the United States is *P. lunifrons,* also called *republican swallow, mud-swallow,* and *eaves-swallow.* These build nests almost entirely of pellets of mud stuck together in masses on the sides of cliffs, under eaves, etc. Rough-winged swallows are several forms of the genera *Psalidoprocne* and *Stelgidopteryx,* as *S. serripennis* of the United States, having the outer web of the first primary serrate with a series of recurved hooks. It is of dull-grayish coloration, resembling the bank-swallow. The white-bellied swallow of the United States is *Tachycineta* or *Iridoprocne bicolor,* of a lustrous greenish-black above and snowy-white below. A still more beautiful related species is the violet-green swallow of western North America, *Tachycineta thalassina.* The Bahaman swallow, *Callichelidon cyaneiviridis,* is a beautiful swallow resembling the violet-green, with sheeny upper parts and white under parts, belonging to the Bahamas and rarely found in Florida. Swallows are mainly insectivorous birds (though some of them eat berries also), and usually capture their prey on the wing with great address. Their wings are long, pointed, and narrow-bladed, giving great buoyancy, speed, and extension of flight. The feet are small and weak, and scarcely used for progression, but chiefly for perching and clinging. The song is a varied and voluble twittering, but the American martin has a strong, rich, musical note. Swallows are in most countries migratory; and those of Europe and America have long been noted, not only for the extent, but also for the regularity, of their migratory movements. Each species has its regular time of appearing in the spring, which may be predicted with much confidence; it is, however, to some extent dependent upon the weather, or the general advancement or retardation of the opening of the season. In the autumn swallows are often governed in leaving their summer resorts by the approach of storms or cold weather, and they are thus to some extent weather-prophets. Their modes of nesting are more variable than is usually the case among birds so intimately related in other habits and in structure; and swallows also show, to an extent unequaled by other birds, a readiness to modify their primitive nesting-habits in populous regions. Thus, the nidification of the seven species of swallows which are common in the United States shows four distinct categories: (1) holes in the ground, dug by the birds, slightly furnished with soft materials: bank-swallow, rough-winged swallow; (2) holes in trees or rocks, not made by the birds, fairly furnished with soft materials: white-bellied and violet-green swallows and purple martin; (3) holes or their equivalents, not made by the birds, but secured through human agency, and more or less furnished with soft materials by the birds: formerly no species, now six of the seven species (all excepting the bank-swallow); (4) nests elaborately constructed by the birds, plastered to natural or artificial surfaces, and loosely furnished with soft materials: the cliff-swallow and the barn-swallow, especially the former. The eggs of the swallows likewise differ more than is usual in the same family, some being pure-white, others profusely spotted. Among species in the United States, two, the barn-swallow and the cliff-swallow, lay spotted eggs; the other five, whole-colored eggs. This difference is interesting, taken in connection with the mode of breeding, since it is the general rule with birds that hole-breeders lay white eggs, and that nest-builders, especially those whose nests are elaborate and open, lay colored eggs. See also cuts under *bank-swallow, barn-swallow, eaves-swallow, hive-nest, Progne, rough-winged,* and *three-tailed.*

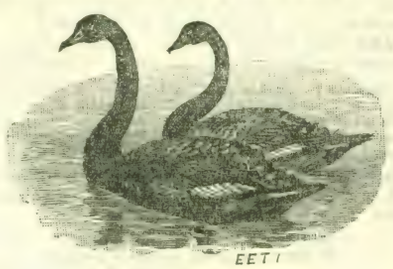
swan[1] (swon), *n.* [< ME. *swan, swon,* < AS. *swan* = MD. *swaen*, D. *zwaan* = MLG. *swan, swane* = OHG. *swan*, m., *swana*, f., MHG. *swan, swane*, G. *schwan* = Icel. *svanr* = Sw. *svan* = Dan. *svane* = Goth. **swans* (not recorded), a swan; perhaps allied to Skt. √ *svan*, L. *sonare*, sound: see *sound*[5]. Cf. AS. *hana* = G. *hahn*, etc., a cock, as related to L. *canere*, sing: see *hen*[1].] **1.** A large lamellirostral palmiped bird, of the family *Anatidæ* and subfamily *Cygninæ*, with a long and flexible neck, naked lores, reticulate tarsi, and simple or slightly lobed hallux. The neck is usually held in a graceful curve while the bird is swimming; the inner flight-feathers are usually enlarged, and capable of being erected or set like sails to waft the bird over the water; and in most of the species the plumage of the adults is snow-white in both sexes. The young of the white species are usually grayish or brownish; they are called *cygnets*. Swans walk awkwardly on land, in consequence of the backward position of the legs, but their movements on the water are exceptionally graceful and stately. Hence they are very ornamental, and some of them have been kept from time immemorial in a state of domestication. Swans are chiefly herbivorous. The flesh is edible, and the plumage furnishes the valuable swan's-down. There are 8 or 10 species, found in most parts of the world, except Africa. The ordinary white swans fall into two groups—*Cygnus* proper, with a knob on the beak, and *Olor*, without a knob; the latter are also distinguished by the resonant quality of the voice, due to the convolutions of the windpipe in the cavity of the breast-bone. In Europe four kinds of swans are found: (1) the common "tame" or mute swan, usually seen in domestication, *C. gibbus* (by the rules of nomenclature also



European White Swan (*Cygnus olor*).

called *C. olor*), with a knob on the beak, wedge-shaped tail, and no tracheal convolutions; (2) the elk, hooper, whooper, or whistling-swan, *Olor cygnus* or *Cygnus* (*O.*) *musicus* or *ferus*, sometimes specified as the "wild" swan; (3) Bewick's swan, *C.* (*O.*) *bewicki;* (4) the Polish swan, *C.* (*O.*) *immutabilis*. Two kinds of swans are common in North America, both belonging, like the three named last, to *Olor:* these are the whistling swan, *C.* (*O.*) *americanus* or *columbianus*, and the trumpeter, *C.* (*O.*) *buccinator;* the former has a small yellow spot on each side of the beak, and is smaller than the latter, of which the beak is entirely black. The black-necked swan of South America

Black-necked Swan (*Sthenelides melanocoryphus*).

is *C.* (*Sthenelides*) *nigricollis* or *melanocoryphus*, with a frontal knob, and the body, wings, and tail pure-white. The black swan of Australia is *Chenopsis* (usually miscalled *Chenopis*) *atratus*, almost entirely black, with white

on the wing (some feathers of which are curly), carmine and white bill, and red eyes; it is easily acclimatized, and is often seen in domestication. A gigantic fossil swan, or swan-like goose, from the bone-caves of Malta, is known as *Palæocygnus falconeri*. The popular notion that the swan sings just before dying has no foundation in fact.

The jelous *swan* agens hire deth that syngeth.
Chaucer, Parliament of Fowls, l. 342.

2. In *her.*, a bearing representing a swan, usually with the wings raised as it carries them when swimming. It is therefore not necessary to say in the blazon "with wings indorsed." See below.—**3.** In *astron.* See *Cygnus*, 2.—**Black swan.** (*a*) Something very rare, or supposed to be non-existent; a rara avis: used like "white crow," and some other apparent contradictions in terms. [The phrase arose at a time when only white swans were known.]

The abuse of such places [theaters] was so great that for any chaste liuer to haunt them was a *black swan*, and a white crowe. *Gosson*, Schoole of Abuse.

(*b*) See def. 1.—**Chained swan,** in *her.*, a swan represented with some kind of collar about its neck, to which a chain is secured, which may be either carried to a ring or staple, or passed in a curve over the bird's neck, between its wings, or the like. The swan ducally gorged and chained is the well-known badge of the Bohuns, adopted by the Lancastrian kings.—**Demi-swan,** in *her.*, a swan with only so much of the body showing as rises above the water when it is swimming, the wings either indorsed or expanded.—**Order of the Swan,** a Prussian order founded by the elector Frederick II., Margrave of Brandenburg, in 1440, renewed by Frederick William IV., King of Prussia, in 1843.—**Swan close,** in *her.*, a bearing representing a swan with the wings close to its side.—**Wild swan,** any feral swan; specifically, *Cygnus ferus* (*C. musicus*): so called in distinction from the "tame" or mute swan. See def. 1.

A melody loud and sweet,
That made the *wild-swan* pause in her cloud.
Tennyson, The Poet's Song.

There are about 70 species, natives of tropical America, except one which is African. The leaves are odd-pinnate or sometimes reduced to a single leaflet; the flowers are commonly borne in clustered or panicled racemes. They are mostly large forest-trees yielding a very hard and durable timber. *Tounatea tomentosa*, the panococo or palo santo tree of Guiana, becomes 60 feet high and 3 feet thick. Its bark, called *panococo-bark*, is a powerful sudorific, and yields a red juice which hardens into a blackish resin. *Tounatea grandiflora* (*Swartzia grandiflora* of Willdenow), of the West Indies and southward, a small tree or shrub known as *naranjillo amarillo*, also yields a valuable and very heavy wood.

Swartzieæ (swart-si-ē'ē-ē), *n. pl.* [NL. (A. The plants of this group form a sort of transition from the *Cæsalpiniaceæ* to the *Fabaceæ* (*Papilionaceæ* of authors who treat it as a subfamily of the *Leguminosæ*), as they usually have an exterior upper petal. They differ, however, from that family in their numerous and separate stamens, and corolla not at all papilionaceous but composed of five nearly equal petals, or of a single broad one, or wholly without petals. It consists of 7 genera, and includes about 86 species, mainly trees with pinnate leaves, natives of tropical Africa and South America, especially of Brazil.

Swedenborgian (swē-dn-bôr'ji-an), *a.* and *n.* [< *Swedenborg*, the name of a Swedish family, changed from *Svedberg* when it was ennobled in 1719.] I. *a.* Pertaining or relating to Emanuel Swedenborg (1688–1772), a Swedish scientific and religious author, or to Swedenborgianism.

II. *n.* A believer in the theology and religious doctrines of Swedenborg; a New Churchman. Swedenborg held Rev. xxi. 2, "And I John saw the holy city, new Jerusalem, coming down from God out of heaven," to be a prediction of the establishment of a new dispensation, the initiation of which took place by the execution of the last judgment in the spiritual world in the year 1757, whereby man was restored to moral freedom by the restriction of evil infestations, the power of which had threatened its utter extinction. In proof of this belief, his followers point to the unparalleled spiritual and material progress of mankind since that date. They were first organized in London (where Swedenborg long resided) in 1788, under the name of the "Society of the New Church signified by the New Jerusalem," usually abbreviated to New Church. Professed Swedenborgians, though widely scattered, have never been numerous; but Swedenborg himself appears not to have contemplated the formation of a separate church, trusting to the permeation of his doctrines through the existing churches. Swedenborgians believe that this process is going on, and that thus the new dispensation is making its way independently of their own organization or efforts, and even without the conscious knowledge of most of those affected by it. Swedenborg considered himself the divinely appointed herald and expounder of this dispensation, being prepared for the office by open intercourse during many years with spirits and angels (all originally human beings), and with God himself, who revealed to him the spiritual or symbolic sense of the Divine Word (which the world had not previously been in a state to receive or apprehend), setting forth spiritual and celestial truths in every part through the correspondence of all material things with the spiritual principles, good or evil, of which they are the outgrowth and manifestation. This doctrine of correspondences is the foundation of his system, which he elaborated with uniform consistency in many volumes, all first published in Latin. In this correspondence consists the plenary inspiration of the Word, which includes only the Pentateuch, Joshua, Judges, Samuel, Kings, the Prophets and Psalms, the four Gospels, and the Apocalypse; the other books of the Bible are valuable for instruction, but lack this divine character.

2. To move on or in water by natural means of locomotion, as an animal, many of which can so move, though the water be not their natural element, and swimming not their habit. The act is accomplished in many ways, by different movements of the body or of the limbs, or by various combinations of such motions. Man swims with the arms and legs, or with the legs alone, in an attitude and with an action most like that of the frog. Ordinary quadrupeds can swim with movements of the legs much like walking. Some of these are specially fitted for swimming without decided modification of structure, as the otter, the beaver, the muskrat, though often in these cases the tail takes some part in propelling or guiding the animal; the eared seals, the *Otariidæ,* swim with their long fore flippers, while the earless seals, the *Phocidæ,* move their hind flippers from side to side, like the tail of a fish, the fore flippers being little used. Sirenians and cetaceans swim entirely with the tail, which is moved vertically. Web-footed birds, and some whose feet are scarcely or not webbed, swim on or under water, chiefly by means of the feet; but many of them accomplish a kind of flight under water with the wings, and use the feet chiefly as rudders. Such is especially the case with penguins, whose wings are flipper-like; and with the dippers (*Cinclidæ*), which are thrush-like birds, and fly under water as they do in the air, without using their feet at all. Aquatic serpents swim with a wriggling or writhing motion of the whole body like that with which they crawl on land; in some of these, however, the tail is flattened to serve as a fin. (See *Hydrophidæ,* and cuts under *sea-serpent, Hydrophis,* and *Platurus.*) Aquatic anurous batrachians swim with their legs alone, when adult; their larvæ (tadpoles), and all tailed batrachians, swim like fishes, by movements of the hind part of the body and tail. Aquatic turtles swim with all four legs, and especially, in the cases of the marine forms, with their enlarged fore flippers. Nearly all crustaceans are aquatic, and swim with very variously modified limbs and tail, their natatorial organs being usually abdominal or postabdominal. (See *swimmeret, pleopod, rhipidura.*) Many insects swim by the movement of specially modified legs which serve as oars, or in the cases of larvæ by undulatory movements of the whole body; some swim only on their backs, and others float, walk, or run on the surface of the water. A few mollusks, without shells, swim with an undulation of the body or of processes of the mantle, but their usual modes of swimming are unlike those of animals with ordinary limbs or tail; some swim by energetic flapping of bivalved shells, others by ejecting a stream of water through siphons, or by setting a sort of sail which wafts them over the water. Aquatic worms swim by wriggling the whole body, and also by the action of multitudinous parapods or cilia. Jellyfishes and comb-jellies swim by rhythmical pulsations of a swimming-bell, or of the whole body, assisted or not by the action of some special organs. Animalcules swim mainly by ciliary action, but also by changes in the shapes of their bodies, and in some cases by special formations. See *swimming-bell, -bladder, -fin, -foot.*

The word is commonly used in the plural, *swine*, as a collective noun, meaning several individuals of a given species, as of the domestic hog, or several kinds of swinish animals, as the hog, the wart-hog, the peccary, the babirussa, etc. The most important breeds of swine are those originated in England during the present century. Some have been produced by crossing native hogs with China and Italian (Neapolitan) breeds. Among the most prominent are the following: the Berkshires, black pigs, with white on the feet, face, tip of the tail, and occasionally on the arm, and erect ears of medium size; the Essex, black pigs of small to medium size, with small ears at first erect, later drooping; and the Yorkshires, a well-established breed of large and small hogs of white color, resembling the Suffolk breed, also with white skin and small upright ears. Neapolitans represent a breed of rather small Italian swine, seldom bred in the United States. They are described as having a bluish-plum or slaty color, the skin nearly free from hair, and the ears small, standing forward horizontally. The English varieties, especially the Berkshires, are largely bred in the United States, where are also raised a number of native breeds. The Poland-China originated during the present century in Ohio from several breeds, including some so-called China hogs. They are characterized by a dark spotted or black color, small, broad, slightly concave face, and fine, drooping ears. The Duroc-Jersey, of unknown origin, has been bred in New Jersey for many years; they are large red animals with lopped ears. The Chester white originated in Chester county, Pennsylvania. Cheshires and Victorias are white swine, originating in New York State, which do not represent distinct breeds. The disease is caused by specific bacteria, and is localized in the lungs, giving rise to pneumonia and pleurisy. The digestive tract may be secondarily involved. In such cases diphtheritic inflammation of the mucous membrane of the large intestine is present. Swine-plague is not readily distinguished from hog-cholera. In the latter disease the lesions, chiefly limited to the large intestine, are in the form of round button-shaped ulcers and diphtheritic patches. Lung-disease is slight or absent. The specific bacteria causing hog-cholera are readily distinguished from those of swine-plague, and upon this distinction the diagnosis is mainly based. The introduction of diseased swine into a herd is probably the main cause of the spreading of both maladies.

2. A mechanical device for shifting a moving body, or a current of electricity, etc., from one course or track to another. Specifically—(*a*) In railroads, in its simplest form, two parallel lengths of rails joined together by rods, pivoted at one end, and free to move at the other end, forming a part of the track at its junction with a branch or siding. The switch-rails rest on metal plates laid on the sleepers, and, by means of a rod fastened to their free ends, can be moved sidewise. The ends of the next pair of rails and the ends of the first pair of the siding or branch are placed side by side, so that by the movement of the switch either pair may be brought in line with the track, and any car or engine passing the switch will be guided upon the rails to which the switch is directed. This form of switch, called a *stub switch*, is now seldom used. In the *split switch*, the movable rails are split, or tapered, to a thin, sharp point. Where it is used at the junction of a line track with a siding, one line-rail, or stock-rail, is continuous and unbroken, and the other stock-rail is continuous with the corresponding rail of the siding. The switch rails, called the points, are joined together, and, when the switch is open, or leading to the siding, one is tightly pressed against one stock-rail and the other is clear. A car, entering the siding, has one wheel diverted by the point to the siding rail, while the other wheel freely travels upon the continuous stock-rail, as it joins the siding rail. When the switch is closed, one wheel is diverted by the point now pressed against the siding rail, and moves along the line, while the other

wheel is free to follow the continuous stock-rail. When the switch is closed, the points are, for safety, kept in position by powerful springs. Incidentally, the springs also allow a car to pass out of the siding when the switch is

Section of fig. 1. *a*, *a*, main tracks; *b*, *b*, branch tracks, or sidings; *c*, *c*, single frogs; *c'*, *c'*, double frogs; *d*, switch-bar or -rod (that nearest the point is called the *front rod*); *e*, switch-stand, with butterfly-signal and lamp. In fig. 4 the switches are shown as arranged at a crossing for shifting a train from one track to another in either direction. The outer rails in point-switches are full rails and rigidly spiked to the ties, while the inner are movable and taper to a point (whence the term *split*, as applied to them, is derived). In stub-switches the rails are full, and the rails of the main track adjacent to the branch as well as the branch rails are rigid, while the movable rails are on that part of the main track which meets the branch. The double-slip switch is simply composed of four point-switches.

closed without being derailed, or without breaking the points. This rarely happens, since the derail prevents the accidental escape of cars from sidings. Switches are usually interlocked to prevent accidental movements of the points. When a switch leads from a line track to a siding in the direction of the traffic, it is said to be a *facing-point* switch. When the switch leads backward from the line, so that a car must back into the siding, it is called a *trailing-point* switch, this form being the safer of the two. Single switches are often operated on the ground by means of hand levers. At cross-overs, at stations, and in yards the majority of all the various forms of switches are controlled from a central point, or switch-tower, by means of mechanical, pneumatic, electric, or electro-pneumatic appliances. The slip switch and double split switch are modifications of the split switch adapted to the many complicated track combinations employed at stations and railing yards. See *drill-yard*, *signaling*, *frog*2, *detector-bar*, *derail*, and *switch*, in the supplement. (*b*) In *teleg.*, a device used to make or break a circuit, to join two lines of wire or a main wire with a branch wire, or to connect any telegraph, telephone, electric-light, or electric-signal wires in any manner. The most simple form of switch is a lever pivoted at one end and connected with one circuit, and, by its movement laterally, used to connect that circuit with one of several others. See *switch*, *n.*, 2 (*c*) in the supplement, *switchboard*.

The name would thus mean lit. 'fig-shower,' of which the historical origin is unknown. (*a*) According to ancient writers, it originally applied to 'one who informed on another for the exporting of figs from Attica' (which is said to have been forbidden); or (*b*) to 'one who informed on another for plundering sacred fig-trees'; (*c*) a third explanation makes it orig. 'one who brings figs (hidden in the foliage) to light by shaking the tree,' hence 'one who makes rich men yield tribute by means of false accusations.' All these explanations are doubtless inventions. (*d*) The real explanation appears to lie in some obscene use of σῦκον, fig, this word, and the L. *ficus*, fig, with its Rom. forms, being found in various expressions of an obscene or abusive nature. This origin, whatever its particular nature, would explain the fact, otherwise scarcely explicable, that the original application of the term is without record.] **I.** *n.* 1†. A tale-bearer or informer in general.

The poor man that hath naught to lose is not afraid of the *sycophant* or promoter.
Holland, tr. of Plutarch's Morals, p. 261. (*Trench.*)

This ordinance is in the first table of Solon's lawes, and therefore we may not altogether discredit those which say they did forbid in the old time that men should carry figs out of the countrey of Attica, and that from thence it came that these pick-thanks, which bewray and accuse them that transported figs, were called *sycophants*.
North, tr. of Plutarch, p. 77.

The laws of Draco . . . punished it [theft] with death; . . . Solon afterwards changed the penalty to a pecuniary mulct. And so the Attic laws in general continued, except that once, in a time of dearth, it was made capital to break into a garden and steal figs; but this law, and the informers against the offence, grew so odious that from them all malicious informers were styled *sycophants*: a name which we have much perverted from its original meaning. *Blackstone*, Com., IV. xvii.

syenite (sī′e-nīt), *n.* [< L. *syenites*, sc. *lapis*, lit. ★'stone of Syene,' < *Syene*, < Gr. *Συήνη*, a locality of upper Egypt.] In *petrog.*, a granular igneous rock composed essentially of some kind of alkali feldspar with subordinate amounts of one or more of the dark silicates belonging to the amphibole, pyroxene, or mica groups. It is like granite except that it is quartz-free. The intermediate rock with a small amount of quartz is commonly called *quartz-syenite*. The name *syenites* was given by Pliny to the red granitoid rock extensively quarried at Syene in Egypt. The term *syenite* was introduced into modern geological science by Werner, in 1788, but applied by him to a rock (from the Plauenscher Grund, near Dresden) not identical in composition with the *syenites* of Pliny, which latter is a hornblendic granite, or granite in which mica is replaced by hornblende, whereas the rock which Werner called *syenite* is mainly made up of a mixture of feldspar and hornblende; hence there has long been more or less confusion in regard to the use of this term, depending upon whether the presence of hornblende or the absence of quartz has been deemed the critical point. The definition of Werner, modified as above, has now been almost universally accepted. While the potash feldspars, orthoclase and microcline, usually predominate in syenites, the sodic species, albite and anorthoclase, or intergrowths such as perthite, are abundant in some cases and the terms *sodasyenite* or *natron-syenite* are sometimes applied to such rocks. With a high content in soda feldspar the associated dark silicate is often also a sodic variety, such as riebeckite or ægirite. There is commonly some lime-soda feldspar present in syenite. With the increase of this mineral syenite grades into the rock called *monzonite* (see *monzonite*, in supplement). Syenite with much augite is called *augite-syenite*; that with abundant biotite is called *mica-syenite* or *minette*. Also *sienite*.

syenitic (sī-e-nit′ik), *a.* [< *syenite* + *-ic*.] Containing syenite; resembling syenite, or possessing some of its properties. Also *sienitic*.—**Syenitic granite**, granite which contains hornblende.—**Syenitic porphyry**, a rock with the mineral composition of syenite and of porphyritic texture.

Representing syllables instead of single sounds: said of an alphabetical sign, or of an alphabet or mode of writing: also used substantively.

If it [Cypriote syllabary] had not been . . . superseded, it would doubtless have gradually lost its *syllabic* character, and have become the definitive alphabet of Greece, and therefore of civilized Europe and of the western world. *Isaac Taylor*, The Alphabet, II. 117.

The same sign, once attached to a word, . . . could be used in writing for the phonetic value of this word, with a complete loss of the primitive sense. . . . syllabication (si-lab-i-kā′shon), *n.* [< *syllabicate* + *-ion*.] The formation of syllables; especially, the division of a word into its constituent syllabic parts in writing and printing. The division of a word of more than one syllable into separate syllables is in great measure an artificial process, since a consonant intervening between two vowels is usually (see under *syllable*) to be reckoned as belonging to either one of them not less properly than to the other. This is especially true of the continuable consonants, the semivowels and the fricatives (thus, *follow*, *arrow*, *ever*, *lesser*, *ashes*, etc.); a mute, particularly a surd mute (*p*, *t*, *k*), has more claim to go with the following vowel, because a mute is much more distinctly audible upon a following than after a preceding vowel (in *tea* than in *ate*). We tend also to reckon such a consonant to the vowel of whose force and pitch it seems most to partake; and, a long vowel being regularly a diminuendo utterance, the strength of impulse falling off before it is ended, a following consonant seems naturally to belong to the vowel that succeeds (so *dai-ly*, *ei-ther*, *ea-sy*, etc.); on the other hand, a consonant of any kind after a short accented vowel so shares the latter's mode of utterance as to be naturally and properly combined with it: thus, *bit-er* (*bitter*), *tak-l* (*tackle*), *hon-est*, etc. When two or more actually pronounced consonants come between vowels, it makes a difference whether they are or are not such as readily in our practice combine as initials before a vowel: thus, as we say *ply*, we divide *supply* into *su-plī*, not *sup-lī*; but *subject* only into *sub-jekt*. As for syllabication in printing (when a word has to be broken at the end of a line), that is a different and more difficult matter, partly because many silent consonants (especially in the case of doubled consonants) have to be dealt with; it also pays much regard to the history of a word, dividing this generally, so far as possible, into the parts of which it is etymologically composed; and it has some arbitrary and indefensible usages, such as the invariable separation of *-ing*, by which we get such offenses against true pronunciation as *rag-ing*, *fac-ing*, instead of *ra-ging*, *fa-cing*; and even *mixt-ure*, *junct-ure*, instead of *mix-ture*, *junc-ture*, owing to the notion that *-ure* rather than *-ture* is the ending.

syllabification (si-lab″i-fi-kā′shon), *n.* [< *syllabify* + *-ation*.] Same as *syllabication*.

syllable (sil′a-bl), *n.* [Formerly also *sillable*, *syllabe*, *syllab*; < ME. *sillable*, < OF. *syllable*, *sillable* (with unorig. *-le*, as in *principle*, etc.), prop. *syllabe*, *sillabe*, < OF. *syllabe* = F. *syllabe* = Sp. *sílaba* = Pg. *syllaba* = It. *sillaba* = G. *silbe*, < L. *syllaba*, ML. also *sillaba*, < Gr. *συλλαβή*, a syllable, several sounds or letters taken or joined together, lit. a taking together, < *συλλαμβάνειν*, take together, put together, < *σύν*, with, together, + *λαμβάνειν*, *λαβεῖν*, take.] 1. The smallest separately articulated element in human utterance; a vowel, alone, or accompanied by one or more consonants, and separated by these or by a pause from a preceding or following vowel; one of the successive parts or joints into which articulated speech is divided, being either a whole word, composed of a single vowel (whether simple or compound) with accompanying consonants, or a part of a word containing such a vowel, separated from a preceding or following vowel either by a hiatus (that is, an instant of silence) or, much more usually, by an intervening consonant, or more than one. Syllables are the separate successive parts into which the ear apprehends the continuous utterances of speech as divided, their separateness consisting mainly in the alternation of opener and closer elements, or vowels and consonants. A normal syllable is a vowel utterance attended with subsidiary consonantal utterances. As to what sounds shall have vowel value in syllable-making, different languages differ; English allows, besides those usually called vowels, also *l* and *n*, as in *reckon* (rek-n), *reckoned* (rek-nd), *riddle* (rid-l), *riddles* (rid-lz). If the vowel is attended by both sonant and surd consonants, the sonant are in general nearer it, as in *print*, *flirt*; and also, as in the same words, the opener sounds are nearer it than the closer. But the intricacy of construction of English syllables is tolerated by but few languages; and many (as the Polynesian) will bear nothing more than a single consonant to a vowel, and that one only before it. The assignment of a consonant or of consonants in syllabication to the preceding or the following vowel is in great part a matter of convention, depending on no real principle: thus, in *alley*, for example, the *l* is a division between the two vowels, like a wall between two fields, belonging to one no more than to the other. It is on syllabic division that the "articulate" character of human speech depends. (See *articulate*. Also compare *vowel* and *consonant*.) In prosody syllables are classed as *long*, *short*, and *common* (see these adjectives). See also *time*.

(Ps. xix. 9, 10.) Also sometimes used as equivalent to *synesis*.

syllogism (sil'ō-jizm), *n.* [Formerly also *sillogism*, *sillagisme;* < ME. *sillogisme*, *silogisme*, < OF. *syllogisme*, *sillogisme*, F. *syllogisme* = Sp. *silogismo* = Pg. *syllogismo* = It. *sillogismo*, *silogismo*, < L. *syllogismus*, < Gr. *συλλογισμός*, a reckoning all together, a reasoning, a conclusion, < *συλλογίζεσθαι*, bring together premises, infer, conclude, < *σύν*, together, + *λογίζεσθαι*, reason, < *λόγος*, word, something spoken: see *Logos*.] 1. A logical formula consisting of two premises and a conclusion alleged to follow from them, in which a term contained in both premises disappears: but the truth of neither the premises nor the conclusion is necessarily asserted. This definition includes the *modus ponens* (which see, under *modus*), the formula of which is that from the following from an antecedent of a consequent, together with the antecedent, follows the consequent. This depends upon two principles—first, the principle of identity, that anything follows from itself; and, secondly, the principle that to say that from A it follows that from B follows C is the same as to say that from A and B follows C. Under the former principle comes the formula that the following from an antecedent of a consequent follows from itself, and this, according to the second principle, is identical with the principle of the *modus ponens*. But the syllogism is often restricted to those formulæ which embody the *nota notæ* (or maxim, *nota notæ est nota rei ipsius*), which may be stated under the form—from the following of anything from a consequent follows the following of the same thing from the antecedent of that consequent. Under this form it is the principle of contraposition. The simplest possible of such syllogisms is like this: Enoch was a man; hence, since being mortal is a consequence of being a man, Enoch was mortal. All syllogisms except the *modus ponens* involve this principle. A syllogism which involves only this principle, and that in the simplest and directest manner, like the last example, is called a *syllogism in Barbara*. In such a syllogism the premise enunciating a general rule is called the *major premise*, while that which subsumes a case under that rule is called the *minor premise*. A syllogism whose cogency depends only upon what is within the domain of consciousness is called an *explicatory* (or *analytic*) *syllogism*. A syllogism which supposes (though only problematically) a generalizing character in nature is called an *ampliative* (or *synthetic*) *syllogism*. (See *explicative inference* (under *inference*), and *induction*, 5.) Analytic syllogisms are either necessary or probable. Necessary syllogisms are either non-relative or relative. Non-relative syllogisms are either categorical or hypothetical, but that is a trifling distinction. They are also either direct or indirect. A direct syllogism is one which applies the principle of contraposition in a direct and simple manner. An indirect syllogism is either minor or major. A minor indirect syllogism is one which from the major premise of a direct (or less indirect) syllogism and a consequence which would follow from its conclusion infers that the same consequence would follow from the minor premise. The following is an example: All men are mortal; but if Enoch and Elijah were mortal, the Bible errs; hence, if Enoch and Elijah were men, the Bible errs. A major indirect syllogism is one which from the minor premise of another syllogism and a consequence from the conclusion infers that the same thing would follow from the major premise. Example: All patriarchs are men; but if all patriarchs die, the Bible errs; hence, if all men die, the Bible errs. Such inversions may be much complicated: thus, No one translated is mortal; but if no mortals go to heaven, I am much mistaken; hence, if all who go to heaven are translated, I am much mistaken. To say that from a proposition it would follow that I err when I know I am right would amount to denying that proposition, and, conversely, to deny it positively would amount to saying that, if it were true, I should be wrong when I know I am right. A denial is thus the precise logical equivalent of that consequence. An indirect syllogism in which the contraposition involves such a consequence is said to be of the second or third figure, according as its indirection is of the minor or major kind. The fourth figure, admitted by some logicians, depends upon contraposition of the same sort, but more complicated, like the last example. The first figure comprises, in some sects of logic, the direct syllogism only; in others, the direct syllogisms together with those which are otherwise assigned to the fourth figure. (See *figure*, 9.) The names of the different varieties, called *moods of syllogism*, are given by Petrus Hispanus in these hexameters:

Barbara: Celarent: Darii: Ferio: Baralipton:
Celantes: Dabitis: Fapesmo: Frisesomorum.
Cesare: Camestres: Festino: Baroco: Darapti:
Felapton: Disamis: Datisi: Bocardo: Ferison.

(See these words, and *mood*[2], 2.) Probable deductive syllogisms are really direct statistical inferences (which see, under *inference*). The following is an example: In the African race there are more female than male births; the colored children under one year of age in the United States at the time of the census of 1880 form a random sample of births of Africans; hence, there should be more females than males under one year of age among the colored population of the United States in 1880. The conditions of the validity of such a syllogism are two: first, the character forming the major term (here that of the relative numbers of females and males) must be taken at random—that is, it must not be one which is likely to be subject to peculiar uniformities which could affect the conclusion; second, the minor term, or sample taken, must be numerous and a random sample—that is, not likely to be of a markedly different character from that which is general in the class sampled. The conclusion is probable and approximate—that is, the larger the sample is the smaller will be the probable error of the predicted ratio. Synthetical or ampliative syllogisms are indirect probable syllogisms. The major indirect probable syllogism is induction (which see). The following is an example: The colored children under one year of age in the United States in 1880 form a random sample of births of Africans; but if there ought to have been more males than females among those children, the colored population of the United States is very different from the bulk of Africans; hence, if in the African race in general there are more male than female births, the colored population of the United States is very different from the bulk of Africans. It must be remembered that an observation of a ratio is never exact, but merely admits some values and excludes others; its denial excludes the former, and admits the latter. The denial of a statistical rule is thus itself a statistical rule; and hence such forms as the following are indirect probable syllogisms: American colored children under one year of age in 1880 form a sample of African births; among these the females are in excess; hence, in African births generally the females are probably in excess. The minor indirect probable syllogism is hypothetic inference. (See *hypothesis*, 4.) Relative syllogisms are those which involve other than merely transitive relations. These were first studied by De Morgan, and afterward by an American logician, but were involved in much difficulty until another American student, O. H. Mitchell, furnished in 1882 the clue to their unravelment. Every relative syllogism has at its core a non-relative syllogism, but this is generalized in a peculiar way—namely, every relative term refers to two or more universes, which may be coextensive, or may be entirely unlike as universes of material things, of space, of time, of qualities, etc. A relative proposition refers to some or all of each of several universes, and the order of the reference is material. (See *proposition*, 3.) Transpositions, identifications, and diversifications are performed upon principles now clearly made out. An important circumstance in regard to relative syllogism is that the same premise may be repeatedly introduced with new effect. Among relative syllogisms are comprised all the elements of mathematical reasoning, especially the Fermatian inference, the syllogism of transposed quantity, and the peculiar reasoning of the differential calculus.

The spelling *sylph* (NL. *sylpha*), with *y* instead of *i*, seems to have been used to make it look more like *nymph*, and because to occultists and quacks like Paracelsus words spelled with *y* look more Greek and convincing. As *salamander*, orig. 'a kind of lizard supposed to live in fire,' was made, by an easy transfer, to mean 'a spirit of fire,' and *gnome*, quite arbitrarily (see *gnome*2), was made to mean 'a spirit of earth,' so *sylph*, orig. (in the Gr. σίλφη) 'a beetle or insect,' seems to have been taken as 'a light flying creature,' hence 'a spirit of the air.' Sylvia (sil'vi-ä), *n.* [NL. (Scopoli, 1769), also *Silvia* (Cuvier, 1800), < L. *silva, sylva*, a wood, a forest.] **1.** In *ornith.*: (*a*) A genus of small dentirostral or turdoid oscine passerine birds, typical of the family *Sylviidæ;* the warblers proper. This genus was originally constituted for a part of the Linnean genus *Motacilla*, and has been loosely used for several hundred small warbler-like birds of both hemispheres, now dissociated in different families. The name is commonly attributed to Latham (1790), but was first used by Scopoli in 1769. The type is now assumed to be the common whitethroat, *Motacilla sylvia* of Linnæus, *Sylvia cinerea* of Bechstein, also called *S. rufa;* and the term is restricted to a few very closely related species of chiefly Palearctic warblers, of small size, with scutellate tarsi, bristled gape, twelve tail-feathers, axillaries never yellow, first primary spurious, and the bill strictly sylviine. Some of the leading species in this narrow sense are *S. nisoria*, the barred warbler; *S. hortensis*, the pettichaps or garden-warbler (see cut under *pettichaps*); *S. curruca*, the lesser whitethroat; *S. atricapilla*, the blackcap; *S. orphea*, the orphean warbler. These, like *S. cinerea*, are all found in Great Britain. No bird of this genus occurs in America, though most of the American warblers which were known to the older ornithologists were placed in *Sylvia*. It is the most marked and persistent of all the fissures, recognizable in some animals the surface of whose cerebrum is otherwise perfectly smooth; in man it is very deep, and incloses the island of Reil, or insula constituted by the gyri operti. The name is sometimes restricted to the posterior or horizontal branch of the fissure, or that part which is commonly present in other animals than man.—**Sylvian ventricle**, the camera, pseudocœle, or so-called fifth ventricle of the brain.

In *ornith.*: (*a*) A genus of American warblers, proposed by Swainson in 1827, for many years in use, and giving name to the family *Sylvicolidæ*. It was based upon the blue yellow-backed warbler, *S. americana*, subsequently made the type of the genera *Chloris* (Boie, 1826), *Parula* (Bonaparte, 1838), and *Compsothlypis* (Cabanis, 1850), and generally applied to the species of *Dendrœca* and some related genera before the recognition of the fact that the name was preoccupied. It fell into disuse about 1842, and the name of the family has since been changed to *Mniotiltidæ* or *Dendrœcidæ*. See these family names. The limits of the family, like those of its representative genus, have fluctuated widely, and no exclusive diagnosis is practicable. As compared with *Turdidæ*, the *Sylviidæ* differ in the usually unspotted plumage of the young birds, which differ little from the adults. Compared with *Muscicapidæ*, the *Sylviidæ* lack the breadth and flatness of the bill which characterize the true flycatchers, and the great development of the rictal bristles. The family is very widely distributed in the eastern hemisphere, but is scarcely represented in America, where the birds formerly classed as *Sylviidæ* are, with very few exceptions, *Mniotiltidæ*, having but nine primaries and being otherwise quite different. The *Sylviidæ* include many modern genera, and are variously subdivided. In one classification they are made to consist of 7 subfamilies — *Drymœcinæ, Calamoherpinæ, Phylloscopinæ, Sylviinæ, Ruticillinæ, Saxicolinæ,* and *Accentorinæ.* See cuts under *nightingale, Phylloscopus, pettichaps, pine-pinc, wheatear,* and *accentor.*

symmetry (sim′e-tri), *n.* [Formerly also *symmetrie, simmetrie;* < OF. *symmetrie*, F. *symétrie* = Sp. *simetría* = Pg. *symetria* = It. *simetria, simmetria* = D. *simmetrie* = G. *symmetrie* = Sw. Dan. *symmetri*, < L. *symmetria*, < Gr. *συμμετρία*, agreement in dimensions, arrangement, etc., due proportion, < *σύμμετρος*, having a common measure, commensurate, even, proportionate, moderate, in due proportion, symmetric, < *σύν*, with, + *μέτρον*, measure.] **1.** Proportionality; commensurability; the due proportion of parts; especially, the proper commensurability of the parts of the human body, according to a canon; hence, congruity; beauty of form. The Greek word *συμμετρία* was probably first applied to the commensurability of numbers, thence to that of the parts of a statue, and soon to elegance of form in general.

2. The metrical correspondence of parts with reference to a median plane, each element of geometrical form having its counterpart upon the opposite side of that plane, in the same continued perpendicular to the plane, and at the same distance from it, so that the two halves are geometrically related as a body and its im-

age in a plane mirror: so, usually, in geometry. Especially, in *arch.*, the exact or geometrical repetition of one half of any structure or composition by the other half, only with the parts arranged in reverse order, as notably in much Renaissance and modern architecture—for instance, in the placing of two spires, exact duplicates of each other, on the front of a church. Such practice is very seldom followed in the best architecture, which in general seeks in its designs to exhibit harmony (see *harmony*, 3), but avoids symmetry in this sense.

We have an Idea of *Symmetry;* and an axiom involved in this Idea is that in a symmetrical natural body, if there be a tendency to modify any member in any manner, there is a tendency to modify all the corresponding members in the same manner.

Whewell, Philos. of Inductive Sciences, I. p. xxx.

John and Jeremiah sat in *symmetry* on opposite sides of the fireplace; the very smiles on their honest faces seemed drawn to a line of exactitude.

Mrs. Gaskell, Sylvia's Lovers, xiv.

3. The composition of like and equably distributed parts to form a unitary whole; a balance between different parts, otherwise than in reference to a medial plane: but the mere repetition of parts, as in a pattern, is not properly called *symmetry.*—**4.** Consistency; congruity; keeping; proper subordination of a part to the whole.

It is in exact *symmetry* with Western usage that this great compilation was not received as a code until the year 1369. *Stubbs*, Medieval and Modern Hist., p. 167.

5. In *biol.*: (*a*) In botany, specifically, agreement in number of parts among the cycles of organs which compose a flower. See *symmetrical*, 5. (*b*) In zoölogy and anatomy, the symmetrical disposition or reversed repetition of parts around an axis or on opposite sides of any plane of the body. *Symmetry* in this sense is something more and other than that due proportion of parts noted in def. 1, since it implies a geometrical representation approximately as in def. 2 (see *promorphology*); it is also to be distinguished from mere metamerism, or the serial repetition of like parts conceived to face one way and not in opposite directions; but it coincides in some cases with *actinomerism*, and in others with *antimerism* or *platetropy* (see *antimere*, *platetrope*). Several sorts of symmetry are recognized. One is *radial* or *actinomeric*, in which like parts are arranged about an axis, from which they radiate like the parts of a flower, as in many zoöphytes and echinoderms; but such symmetry is unusual in the animal kingdom, being mainly confined to some of the lower classes of invertebrates, and even in these the departures from it are frequently obvious. (See *bivium*, *trivium*, and cuts under *echinopædium* and *Spatangoidea*.) The tendency of animal form on the whole being to grow along one main axis (the longitudinal), with symmetrical duplication of parts on each side of the vertical plane (the meson) passing through that axis, it follows that the usual symmetry is *bilateral* (see below). This is exhibited only obscurely, however, by some cylindrical organisms, as worms, whose right and left "sides," though existent, are not well marked; and to such symmetry of ringed or annulose forms the term *zonal* is sometimes applied. When the ordinary metameric divisions of any animal, as a vertebrate or an arthropod, are conceived as not simply serial but also as antitropic, such disposition of parts is regarded as constituting *anteroposterior symmetry*, in which parts are supposed to be reversed repetitions of each other on opposite sides of an imaginary plane dividing the body transversely to its axis, in the same sense that right and left parts are reversed repetitions of each other in bilateral symmetry. The existence of the last is denied or ignored by those who consider the segments of an articulate or vertebrate body as simply serially homologous; but in the view of those who recognize it the back of the arm corresponds to the front of the thigh, the convexity of the elbow (backward) to the convexity of the knee (forward), the extensor brachii to the extensor cruris, etc. Anteroposterior symmetry is also recognized by some naturalists in certain arthropods from the arrangements of the legs (in amphipods, for example), the correspondences observed between anal and oral parts, etc. Since any body is a solid, and therefore may be intersected by three mutually perpendicular planes, two of which are concerned in bilateral and anteroposterior symmetry respectively, a kind of symmetry called *dorsabdominal symmetry* is recognized by some, being that of parts lying upon opposite sides of a longitudinal horizontal plane passing through the axis of the body, as that between the neural and hemal arches of a vertebra; but it is generally obscure, and probably never perfect. *Bilateral symmetry* (see *eudipleural*) is the nearly universal rule in vertebrates and articulates. The chief departures from it in vertebrates are in the family of flatfishes or flounders (as the plaice, turbot, halibut), in parts of the cranium of various cetaceans and the single great tusk of the narwhal, in the skulls (especially the ear-parts) of sundry owls, in the beak of a plover (*Anarhynchus*) which is bent sidewise, in the atrophy of one of the ovaries and oviducts in most birds, and in the position finally assumed by the heart and great vessels and most of the digestive organs of vertebrates at large. (See cuts under *asymmetry*, *narwhal*, *plaice*, and *plover*.) In articulates notable exceptions to it are seen in the difference between the great claws or chelæ of a lobster, etc. In *Mollusca* asymmetry is the rule rather than the exception. (See *Anisopleura*, *Isopleura*.) A certain symmetry, apart from that exhibited by an animal body as a whole, may be also predicated of the several components of any part in their respective selves: as, the *symmetry* of a carpus or of a tarsus whose several bones are regularly disposed on each side of its axial plane, or around a central bone. (See cuts under *carpus* and *tarsus*.) —**Axis of symmetry.** See *axis*[1].—**Center of symmetry.** See *center*[1].—**Kinetical symmetry**, the equality of the principal axes of a body through its center of mass. —**Plane of symmetry**, a symmetral or median plane.—**Quartic symmetry.** See *quartic.*—**Quintic symmetry**, regularity of form depending on a pentagon being regular. See *quintic.*—**Radial symmetry.** See def. 5 (*b*).—**Rectangular** or **right symmetry**, symmetry depending on that of the right angle, or consisting in some angle being a right angle.—**Skew symmetry.** See *skew*[1].—**Uniform symmetry**, in *arch.*, such disposition of parts that the same ordonnance reigns throughout the whole.=**Syn.** *Symmetry*, *Proportion.* *Proportion* is the more general word, being applicable to numbers, etc.; it is also the more abstract. *Symmetry* is limited to the relation of the parts of bodies, especially living bodies: as, *symmetry* in the legs of a horse; it is thus sometimes more external. *Symmetry* sometimes is more expressive of the pleasure of the beholder. "*Symmetry* is the opposition of equal quantities to each other. *Proportion* the connection of unequal quantities with each other. The property of a tree in sending out equal boughs on opposite sides is *symmetrical.* Its sending out shorter and smaller toward the top, *proportional.* In the human face its balance of opposite sides is *symmetry*, its division upwards, *proportion.*" (*Ruskin.*)

sympalmograph (sim-pal′mō-gràf), *n.* [< Gr. σύν, together, + παλμός, vibration (< πάλλειν, vibrate), + γράφειν, write.] A kind of apparatus used to exhibit Lissajous curves (see under *curve*) formed by the combination of two simple harmonic motions. A convenient form employs a double pendulum, the rate of oscillation of whose parts can be varied at will, while a suitable style traces out upon a lampblack surface the curves resulting from the combined motions.

sympathetic (sim-pạ-thet′ik), *a.* and *n.* [Cf. *sympatheticus* (in technical use); < LGr. συμπαθητικός, having sympathy, < Gr. συμπάθεια, sympathy: see *sympathy.*] **I.** *a.* **1.** Pertaining to, expressive of, proceeding from, or exhibiting sympathy, in any sense; attended with sympathy.

H. James, Jr., Trans. Sketches, p. 291.

4. In *anat.* and *zoöl.*, effecting a sympathy or consentaneous affection of the viscera and blood-vessels; uniting viscera and blood-vessels in a nervous action common to them all; inhibitory of or controlling the vital activities of viscera and blood-vessels, which are thereby subjected to a common nervous influence; specifically, of or pertaining to a special set of nerves or nervous system called the *sympathetic.* See below.—**5.** In *acoustics*, noting sounds induced not by a direct vibration-producing force, but by vibrations conveyed through the air or other medium from a body already in vibration. The phenomena of resonance are properly examples of sympathetic sound.—**Sympathetic headache**, pains in the head as the result of comparatively distant irritations.—**Sympathetic ink.** See *ink*[1].—**Sympathetic nerve**, a nerve of the sympathetic system; in particular, one of the two main ganglionated cords extending the whole length of the vertebral column. These ganglia, in man, correspond in number to the vertebræ against which they lie, except in the neck, where there are three pairs, and on the coccyx, where there is but a single one, the ganglion impar. Communicating branches, *rami communicantes*, *rami viscerales*, to and from the spinal and some of the cranial nerves, unite the sympathetic system with the cerebrospinal axis. The branches of distribution of the sympathetic system supply chiefly the trunk-viscera and the walls of the blood-vessels and lymphatics. The sympathetic nerves differ from the cerebrospinal nerves in having generally a grayish or reddish color, and in the greater number and more widely distributed ganglia connected with them. The sympathetic nerve is also called *great sympathetic*, *trisplanchnic*, *ganglionic.*—**Sympathetic nervous system.** (*a*) In vertebrates, a set of nerves consisting essentially of a longitudinal series of ganglia on each side of the spinal axis, connected by commissures or commissural nerve-fibers, forming a double chain from head to tail, and giving off numerous branches which form special plexuses in the principal cavities of the body, and other plexuses surrounding and accompanying the viscera and blood-vessels, distinct from but intimately connected by anastomoses with the nerves of the cerebrospinal system. In man the sympathetic system consists (1) of the two main gangliated chains above described; (2) of four pairs of cranial ganglia; (3) of three great gangliated plexuses or sympathetic plexuses, in the thoracic, abdominal, and pelvic cavities respectively; (4) of smaller ganglia in connection with the abdominal and other viscera; (5) of communicating nerves or commissures, whereby these ganglia or plexuses are connected with one another and with nerves of the cerebrospinal system; (6) of distributory nerves supplying the viscera and vessels, whereby the sympathetic reaches all parts of the body. See *ganglion* and *plexus.* (*b*) In invertebrates, as *Vermes*, a posterior part of the visceral nervous system, passing on to the enteric tube, and corresponding to a true enteric nervous system: so called in view of its physiological relations, without reference to the actual homology implied with the sympathetic system of a vertebrate.—**Sympathetic numbers**, numbers absurdly supposed to have a tendency to come together by chance.—**Sympathetic ophthalmia**, inflammation of one eye due to lesion in the opposite eye.—**Sympathetic powder.** See *powder.* —**Sympathetic resonance**, the communication of vibration from one sounding body to another in its proximity. Thus, if two musical strings are stretched over the same sounding-board and one of them is struck, the other will vibrate also if tuned to the same note, or, further, if tuned to give the octave or the fifth.—**Sympathetic sounds**, sounds produced by means of vibrations caused by the vibrations of some sounding body, these vibrations being communicated by means of the air or some intervening liquid or solid body.—**Sympathetic string**, in various classes of stringed musical instruments, a string that is intended to be sounded by sympathetic vibration, and not by direct excitation.

II. *n.* **1.** The sympathetic nervous system, or the sympathetic nerve.—**2.** One who is peculiarly susceptible, as to hypnotic or mesmeric influences; a sensitive.

Favorable conditions may make any one hypnotic to some extent, in a degree sufficient, perhaps, to dull the physical vision and excite the mental vision. Naturally enough a company of *sympathetics* may be similarly influenced. *N. A. Rev.*, CXLVI. 705.

sympathy (sim′pa-thi), *n.*; pl. *sympathies* (-thiz). [Formerly also *sympathie, simpathie;* = F. *sympathie* = Sp. *simpatía* = Pg. *sympathia* = It. *simpatia,* < L. *sympathia,* < Gr. συμπάθεια, fellow-feeling, community of feeling, sympathy, < συμπαθής, having a fellow-feeling, affected by like feelings, sympathetic, also exciting sympathy, < σύν, with, + πάθος, feeling, passion: see *pathos*. Cf. *apathy, antipathy*.] 1. Feeling identical with or resembling that which another feels; the quality or state of being affected with feelings or emotions corresponding in kind if not in degree to those which another experiences: said of pleasure or pain, but especially of the latter; fellow-feeling; commiseration; compassion. In writers not quite modern an occult influence of one mind (or body) by another is meant, but this meaning is now almost forgotten.

This is by a naturall *simpathie* betweene the eare and the eye, and betweene tunes & colours.
Puttenham, Arte of Eng. Poesie, p. 70.

In order to awaken something of *sympathy* for the unfortunate natives. *Burke*, Fox's East India Bill.

The word *sympathy* may also be used on this occasion, though the sense of it seems to be rather more extensive. In a good sense, it is styled benevolence; and, in certain cases, philanthropy; and, in a figurative way, brotherly love; in others, humanity; in others, charity; in others, pity and compassion; in others, mercy; in others, gratitude; in others, tenderness; in others, patriotism; in others, public spirit.
Bentham, Introd. to Morals and Legislation, x. 25.

Although we commonly have in view feeling for pain rather than for pleasure when we talk of *sympathy*, this last really includes both.
J. Sully, Outlines of Psychol., p. 510.

It is true that *sympathy* does not necessarily follow from the mere fact of gregariousness. Cattle do not help a wounded comrade; on the contrary, they are more likely to dispatch him.
W. James, Prin. of Psychology, II. 210.

2. An agreement of affections or inclinations, or a conformity of natural disposition which makes two persons agreeable each to the other; mutual or reciprocal inclination or affection; sympathetic interest: in this sense commonly followed by *with:* as, to have *sympathy with* a person in his hopes, aspirations, or aims.

Yea, I think there was a kind of *sympathy* betwixt that valley and him. *Bunyan*, Pilgrim's Progress, ii.

Priscilla's silent *sympathy with* his purposes, so unalloyed with criticism, and therefore more grateful than any intellectual approbation, which always involves a possible reserve of latent censure.

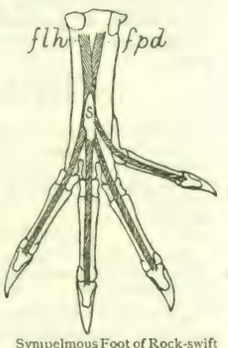
To cultivate *sympathy*, you must be among living creatures, and thinking about them. *Ruskin.*

3. In *physiol.* and *pathol.*: (*a*) That state of an organ or a tissue which has a certain relation to the condition of another organ or tissue in health and disease; a related state of the vital manifestations or actions in different organs or tissues, such that when one part is excited or affected others are also affected; that relation of the organs and parts of a living body to each other whereby a disordered condition of one part induces more or less disorder in another part: as, for example, the pain in the brow caused by taking a draught of cold water into the stomach, the pain in the right shoulder arising from disease of the liver, or the irritation and vomiting produced by a tumor of the brain. (*b*) The influence which the physiological or pathological state of one individual has in producing the same or an analogous state in another at the same time or in rapid succession, as exemplified in the hysterical convulsions which affect a number of women on seeing one of their companions suffering from hysteria, or the yawning produced by seeing another yawn.—4†. Physical action at a distance (so used by old writers against astrology, who argue that the influence of the stars is not physical sympathy and not moral sympathy, and therefore does not exist at all): as, the *sympathy* between the lodestone and iron.



What we call *sympathies* and antipathies depending indeed on the peculiar textures and other modifications of the bodies between whom these friendships and hostilities are said to be exercised, I see not why it should be impossible that there be a cognation betwixt a body of a congruous or convenient texture and the effluviums of any other body. *Boyle*, Hidden Qualities of Air.

5. In *acoustics*, such a relation between the periods of vibration of two bodies that when one body is thrown into vibration the other tends to vibrate in a similar or related way, in consequence of the vibrations communicated to it through the air or some other medium.—**Powder of sympathy.** See *powder.*—**Syn. 1.** *Commiseration, Compassion,* etc. (see *pity*); tenderness.—2. Affinity, harmony.

Symphoricarpos (sim″fō-ri-kär′pos), *n.* [NL. (Dillenius, 1732), so called in allusion to the clustered berries; < Gr. συμφορεῖν, bear together (< σύν, together, + φέρειν = E. *bear*[1]), + καρπός, fruit.] A genus of gamopetalous shrubs, of the family *Caprifoliaceæ* and tribe *Linnæeæ*. It is characterized by flowers with a cup-shaped and four- or five-toothed calyx, a funnel- or bell-shaped corolla bearing as many lobes and epipetalous stamens, and an ovary of four cells, two with a few imperfect ovules, the others each with the ovule solitary, perfect, and pendulous. The 10 species are natives of the United States, Canada, and the mountains of Mexico. They are mainly western; one, *S. occidentalis*, extends north to latitude 64°. They are smooth or hairy shrubs with slender four-angled branchlets and scaly buds, producing opposite ovate leaves which are entire or

obtusely toothed on young plants. The small white or red flowers are arranged in short axillary spikes or in racemes, and are followed by fleshy white or red berries, each with four cells but only two seeds. In several species the corolla is remarkably filled with close white hairs. For the three eastern species, see *coral-berry*, *snowberry*, 1, and *wolfberry*; the first is also known as *Indian currant*, and a general name is *St.-Peter's-wort*.

Symphyla (sim′fi-lạ), *n. pl.* [NL., < Gr. *σύμφυλος*, of the same stock, < *σύν*, together, + *φῦλον*, *φυλή*, a tribe: see *phylum*.] An order of myriapods, combining some characters which are now mostly manifested in widely distinct types. This group is represented by the *Scolopendrellidæ*, and forms in some respects a connecting-link between the classes of myriapods and hexapods. All the known species are small (less than 7 millimeters in length); they resemble minute centipeds, and each abdominal segment bears a pair of legs; with the exception of these appendages, however, the structure resembles that of some thysanurous insects. The legs are five-jointed, and end in a pair of claws.

The reasonableness of placing the *Symphyla* (= Scolopendrella) of Ryder in the Thysanura, with the Collembola and Cinura as coordinate groups.
S. H. Scudder, Mem. Acad. Nat. Sci., III. 90.

symphylous (sim′fi-lus), *a.* [< *Symphyla* + *-ous*.] Having characteristics of the *Symphyla*; combining characters of myriapods with those of the true hexapods, or six-footed insects.

symphynote (sim′fi-nōt), *a.* [< Gr. *συμφυής*, growing together, + *νῶτον*, the back.] Soldered together at the back or hinge, as the valves of some unios, or having valves so soldered, as a unio: the opposite of *asymphynote*.

In some of the species the valves become soldered together at the hinge, so that motion would be impossible were it not for the fact that a fracture takes place near the line of junction, so that one valve bears two wings and the other none. This fact has been used by Dr. Lea to divide the numerous species of Unio into two groups, those with soldered hinge being called *symphynote*, and those with the normal structure asymphynote forms.
Stand. Nat. Hist., I. 270.

symphyogenesis (sim″fi-ō-gen′e-sis), *n.* [< Gr. *συμφύεσθαι*, grow together, + *γένεσις*, generation: see *genesis*.] In *bot.*, the forming of a union by fusion of previously separate elements.

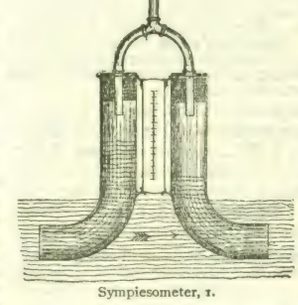
symphyseotomy (sim-fiz-ē-ot′ō-mi), *n.* [< Gr. *σύμφυσις*, symphysis, + *-τομία*, < *τέμνειν*, *ταμεῖν*, cut.] In *surg.*, the operation of dividing the symphysis pubis for the purpose of facilitating labor; the Sigaultian section or operation.



symphysial, symphysian (sim-fiz′i-ạl, -ạn), *a.* ★Same as *symphyseal*.

symphysis (sim′fi-sis), *n.*; pl. *symphyses* (-sēz). In *anat.* and *zoöl.*: (*a*) The union or connection of bones in the middle line of the body, either by confluence, by direct apposition, or by the intervention of cartilage or ligament; also, the part, or configuration of parts, resulting from such union or connection. Symphysis usually constitutes an immovable joint, and may be so intimate that all trace of original separateness of the parts is lost. These two conditions are illustrated in the human body in the symphysis of the pubic bones and of the two halves of the lower jaw respectively; but in many animals symphyses remain freely movable, as in the two halves of the lower jaw of serpents. The term is chiefly restricted to the growing together or close apposition of two halves of a bilaterally symmetrical bone, or of a bone with its fellow of the opposite side—other terms, as *ankylosis*, *synosteosis*, *synchondrosis*, and *suture*, being applied in other cases. See cuts under *innominatum* and *pelvis*. (*b*) Some point or line of union between two parts; a commissure; a chiasm: as, the *symphysis* of the optic nerves. (*c*) Attachment of one part to another; a growing together; insertion or gomphosis with union: as, the *symphysis* of teeth with the jaw. See *acrodont*, *pleurodont*. (*d*) Coalescence or growing together of parts so as to close a natural passage; atresia.—2. In *bot.*, a coalescence or growing together of similar parts.—**Iliac, ischiatic, pubic symphysis.** See the adjectives.—**Mental symphysis, symphysis mandibulæ, symphysis menti**, the union or apposition of the two halves of the lower jaw-bone; the midline of the chin in man, the gonys or gonydeal line of a bird, etc.—**Symphysis pubis**, the pubic symphysis.

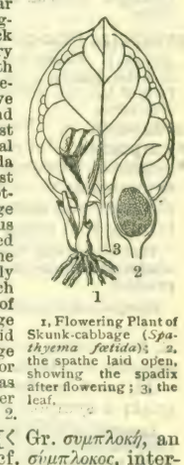
symphytism (sim′fi-tizm), *n.* [< Gr. *σύμφυτος*, growing together, < *συμφύεσθαι*, grow together: see *symphysis*.] In *gram.*, a coalescence of the elements of words. *Earle*.

Symphytum (sim′fi-tum), *n.* [NL. (Tournefort, 1700), < L. *symphyton*, < Gr. *σύμφυτον*, plant, comfrey, boneset (so named from its reputed medicinal power), < *συμφύειν*, make to grow together: see *symphysis*.] A genus of dicotyledonous sympetalous plants, of the family *Boraginaceæ*, tribe *Anchuseæ*. It is characterized by a broadly tubular corolla with short somewhat erect lobes, bearing within five scales and five short stamens with linear anthers. About 15 species are known, natives of Europe, northern Africa, and western Asia, and occasionally naturalized elsewhere, as *S. officinale* in the eastern United States. They are commonly rough erect herbs, sometimes with a tuberous root. They bear alternate or mostly radical leaves, the uppermost sometimes nearly opposite. The flowers are blue, purplish, or yellowish, and form parted terminal cymes or simple one-sided racemes. The species, especially *S. officinale* (see cut under *scorpioid*), are known as *comfrey*. *S. tuberosum* with pale-yellow and *S. asperrimum* with light-blue flowers are occasionally cultivated for ornament. The latter, the prickly comfrey, is also a forage-plant, said to support large flocks and herds in the Caucasus, its native region. It has excited much interest and to some extent been introduced elsewhere, especially in Australia; it is a hardy plant, yielding heavily, and is relished by cattle after they have become accustomed to it, though commonly refused by them at first.

sympiesometer (sim″pi-e-som′e-tėr), *n.* [Irreg. < Gr. *συμπίεσις*, a pressing together (< *συμπιέζειν*, press or squeeze together, < *σύν*, together, + *πιέζειν*, press, squeeze), + *μέτρον*, measure.] 1. An instrument for measuring the pressure of a current. Two tubes are so bent that their upper parts rise vertically above the water. The submerged parts are bent one up the other down stream, and are open at these ends. The vertical parts are joined to one tube from which the air is partially exhausted, so that the level of the water in both tubes can be seen. The difference of levels shows the force of the current.

Sympiesometer, 1.

2. A form of barometer in which the pressure of the atmosphere is balanced partly by the weight of a column of liquid and partly by the elastic pressure of a confined mass of gas. As originally constructed by Adie of Edinburgh, it consists of a short inverted siphon-tube, with a bulb blown on the end of the longer leg, while the shorter leg is left open. The bulb and the upper end of the tube are filled with air or hydrogen, and the lower part of the tube with glycerin. The pressure of the atmosphere exerted upon the surface of the liquid is balanced by the pressure of the inclosed gas and by the weight of the column of liquid which is supported. The level of the liquid constitutes the reading of the instrument. At each observation the scale is adjusted for the temperature, and an attached thermometer forms an essential auxiliary. The sympiesometer is more sensitive than the mercurial barometer, but it does not so well maintain its constancy, and its readings cannot be so accurately corrected and evaluated. An improved form of the instrument consists essentially of a cistern-barometer, with air above the column of liquid instead of a vacuum. The measurement consists in determining the height of a column of liquid required to keep the inclosed air compressed into a standard volume. By this method of use the theory of the instrument is simplified, and the readings are easily evaluated. Also *sympiezometer*.



symplectic (sim-plek′tik), *a.* and *n.* [< Gr. *συμπλεκτικός*, twining together, < *συμπλέκειν*, twine or weave together, < *σύν*, together, + *πλέκειν*, twine, weave: see *plicate*.] **I.** *a.* Placed in or among, or put between, as if ingrained or woven in: specifically noting a bone of the lower jaw of fishes interposed between others.

II. *n.* A bone of the lower jaw or mandibular arch of some vertebrates, as fishes, between the hyomandibular bone above and the quadrate bone below, forming an inferior ossification of the suspensorium of the lower jaw, articulated or ankylosed with the quadrate or its representative. Also called *mesotympanic*. See cuts under *palatoquadrate* and *teleost*.

symplesite (sim′ple-sīt), *n.* [So called in allusion to its relation to the other minerals named; < Gr. *σίν*, together, + *πλησ(ιάζειν)*, bring near, mid. come near (< *πλησίος*, near), + *-ite*[2].] A mineral occurring in monoclinic crystals and crystalline aggregates. It is an arseniate of ferrous iron, belonging in the group with vivianite and erythrite.

Symplocarpeæ (sim-plō-kär′pē-ē), *n. pl.* [NL. (A. Engler, 1876), < *Symplocarpus* + *-eæ*.] A tribe of monocotyledonous plants, of the family *Araceæ*, based on *Symplocarpus* of Salisbury, which, being a synonym, invalidates the tribal name. It consists of three singular monotypic and mostly American genera, of which the largest, *Lysichiton*, occurring in California, Alaska, Siberia, and Japan, produces elliptical leaves reaching 3 feet in length; for the others, see *Orontium* and *Symplocarpus*.

Symplocarpus (sim-plō-kär′pus), *n.* [NL., so called with ref. to the union of the ovaries into a multiple fruit; short for **symplococarpus*, < Gr. *σύμπλοκος*, interwoven (see *symploce*), + *καρπός*, fruit.] A name given by Salisbury in 1818 to *Spathyema*, a genus of monocotyledonous plants, of the family *Araceæ*; the skunk-cabbage. It is characterized by a globose, arching, and hooded persistent spathe containing fertile bisexual flowers crowded on a nearly globular spadix, each with four perianth-segments, four stamens, and a thick four-angled style crowning an ovary with a single cell and ovule or with a second empty cell. The only species, *Spathyema fœtida*, is a native of America, northeastern Asia, and Japan, common in bogs and moist places in the eastern or central United States from Iowa to Florida and in Nova Scotia. It is a robust herb with a thick descending rootstock, producing a crown of large ovate and heart-shaped coriaceous leaves. The streaked or mottled spathe rises a few inches above the ground, and incloses a comparatively small brownish spongy spadix, which ripens into a globose syncarp of berries, each with a single large rounded seed filled with a solid fleshy embryo. From the very large broad leaves, and from its odor when bruised, the plant is known as *skunk-cabbage* (which see, under *cabbage*[1]). See also *dracontium*, 2.

symploce (sim′plō-sē), *n.* [< Gr. *συμπλοκή*, an interweaving, interlacing (cf. *σύμπλοκος*, interwoven), < *συμπλέκειν*, weave together: see *symplectic*.] In *rhet.*, the repetition of one word at the beginning and another at the end of successive clauses, as in the sentence "*Mercy* descended from heaven to dwell on the *earth*; *Mercy* fled back to heaven and left the *earth*." This figure is a combination of epanaphora and epistrophe (whence the name). Also, incorrectly, *simploce*.

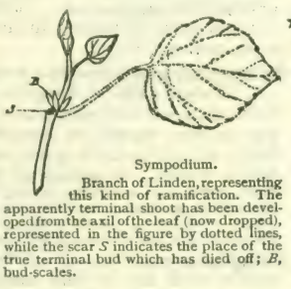
Take me the two former figures [anaphora and antistrophe] and put them into one, and it is that which the Greekes call *symploche*, . . . and is a maner of repetition.
Puttenham, Arte of Eng. Poesie, p. 166.

symplocium (sim-plō′si-um), *n.* [NL.: see *symploce*.] In *bot.*, the sporangium of ferns. [Obsolete.]

Symplocos (sim′plō-kos), *n.* [NL. (J. F. Jacquin, 1760), named from the stamens, which are highly monadelphous in some species; < Gr. *σύμπλοκος*, interwoven: see *symploce*.] A genus of plants, type of the family *Symplocaceæ*. It is characterized by flowers having numerous stamens with short anthers and in many rows, and a two- to five-celled ovary containing two or rarely four pendulous ovules in each cell, and ripening into a fleshy indehiscent fruit crowned with the calyx-lobes, and filled by a single oblong seed having a terete embryo, long radicle, and short cotyledons. There are about 175 species, natives of warmer parts of Asia, Australia, and America, but not known in Africa. They are trees or shrubs, often smooth, and turning yellowish in drying. They bear alternate toothed or entire leaves, and axillary racemes or spikes, sometimes reduced to a single flower. The fruit is an oblong or roundish berry or drupe. Several species, with yellow, red, or white flowers, are occasionally cultivated.

For *S. tinctoria*, the only species in the United States, see *sweetleaf*. The bark and leaves of this and several other species, particularly of *S. racemosa*, the lodh-bark tree of India, are used as a dye. The leaves of *S. ramosissima* of the Himalayas are said to be there the food of the yellow silkworm. All contain an astringent principle in their leaves. The leaves of *S. theæformis*, a branching South American shrub, are used as a substitute for tea in Brazil.

sympode (sim′pōd), *n.* [< *sympodium*, q. v.] Same as *sympodium*.



According to this, the shoot of the vine is a *sympode*, consisting of a number of "podia" placed one over the other in longitudinal series. *Encyc. Brit.*, XXIV. 237.

[NL., < Gr. σύν, with, + πούς (ποδ-) = E. *foot.*] In *bot.*, an axis or stem which imitates a simple stem, but is made up of the bases of a number of axes which arise successively as branches one from another. The grape-vine furnishes a perfect example. Compare *monopodium* and *dichotomy*. Also called *pseudo-axis*.

Sympodium.

Branch of Linden, representing this kind of ramification. The apparently terminal shoot has been developed from the axil of the leaf (now dropped), represented in the figure by dotted lines, while the scar *S* indicates the place of the true terminal bud which has died off; *B*, bud-scales.

Thus in a dichotomous branching only one of the secondary axes may develop strongly, the weaker branch appearing as a small lateral shoot from its base; and an apparent primary shoot is thus produced which in reality consists of the bases of single branches of consecutive forkings. Such an axis is termed a pseudaxis or *sympodium*. *Encyc. Brit.*, IV. 93.

sympolar (sim-pō′lär), *a.* [< Gr. σύν, with, + E. *polar.*] Polar to one another.—**Sympolar pair** of heteropolars, a pair of polyhedra such that to each face of the one corresponds a summit of the other, and vice versa.

An organization of the Jews for the purposes of religious instruction and worship.

The term *synagogue* (like our word church) signifies first the congregation, then also the building where the congregation meet for public worship.
Schaff, Hist. Christ. Church, I. § 51.

2. The building where such instruction and worship are maintained. The synagogue first came into prominence in the religious life of the Jewish people during the exile, and, since the destruction of the temple and the dispersion of the Jews, constitutes their customary place of worship. The organization of the synagogue consists of a board of elders presided over by a ruler of the synagogue (Luke viii. 41, 49, xiii. 14). The worship is conducted according to a prescribed ritual, in which the reading of the Scripture constitutes a prominent part. Formerly the officers of the synagogue exercised certain judicial functions, and the synagogue itself was the place of trial (Luke xii. 11, xxi. 12), but this is no longer the case.

There besyde was the *Synagoge*, where the Bysshoppes of Jewes and the Pharyses camen to gidere, and helden here Conseille. *Mandeville*, Travels, p. 93.

synalephe, synalœphe (sin-a-lē′fē), *n.* [= F. *synalèphe*, < L. *synalœphe*, < Gr. *συναλοιφή*, the contraction of two syllables into one, < *συναλείφειν*, smear together, smooth over, unite, < *σύν*, together, + *ἀλείφειν*, anoint.] The blending of two successive vowels so as to unite them in one syllable, as by syneresis, synizesis, crasis, so-called elision, or a combination of these; especially, the obscuration or suppression of a final vowel-sound (vowel or diphthong) before an initial vowel-sound, as in *th' enemy* for *the enemy*. Usually, as in the instance just given, the final vowel is only obscured, not suppressed, being audible. When the final vowel is entirely suppressed, as in French *l'ami* for *le ami*, there is no longer a true blending or synalephe, but the term has been extended to include such cases. What is commonly called *elision* is usually synalephe or blending, not ecthlipsis or suppression.

The tail is fitted for climbing and scrambling about in trees and bushes, as in the creepers, and the feet are strongly prehensile, with large curved claws. They are small birds (a few inches long), but build huge coarse nests, sometimes 2 or 3 feet in diameter, or as large as a barrel, of sticks and twigs loosely thrown together, in the recesses of which the eggs are laid upon a nest proper of soft substances. There is great uniformity in the eggs, which are of a white or pale-bluish color. The subfamily is also called *Anabatinæ*.

These animals resemble worms, and are of such delicacy of structure as to be almost transparent. The long thin cylindrical body is constricted here and there, and the mouth is surrounded with a fringe of tentacles. The calcareous concretions of the integument which form a hard shell or test in most echinoderms are here reduced to certain flat perforated plates here and there, to which anchorate hooks or anchor-shaped spicules are attached, forming very characteristic structures. (See cuts at *ancora*[1], *Holothurioidea*, and *Synaptidæ*.) There are several species. *S. digitata* is British. *S. girardi* is common on the Atlantic coast of the United States, living in the sand at about low-water mark. Such formations are characteristic of the *Fungiidæ*.

They have five ambulacral canals, a polar mouth and anus, and no Cuvierian organs, no water-lungs, and no pedicels. Locomotion is effected by the peculiar spicules or hard calcareous bodies in the integument, of various shapes, as plates, wheels, and anchors. There are several genera besides *Synapta*, as *Chirodota*, *Myriotrochus*, *Trochoderma*, and *Anapta*. They are fragile marine organisms, vermiform, and so transparent or with such thin and colorless skin that the internal organs may be seen through it. Several genera are hermaphrodite.

See *syncretist.* This word first passed into common use at the Reformation, and was then used indifferently, in both a good and a bad sense, to designate the attempted union of different sects on the basis of tenets common to all. It soon lost all but its contemptuous meaning, and became specifically restricted to the system of a school of thinkers within the Lutheran Church.

The word has somewhat varied application to certain embryonic formations and to some adult tissues, as striped muscular fiber, certain parts of sponges, etc.

syngenesis (sin-jen′e-sis), *n.* [NL., ‹ Gr. *σύν*, together, + *γένεσις*, generation.] Reproduction in which a male and a female take part, one furnishing spermatozoa and the other an ovum, so that the substance of the embryo is actually derived from both parents. This is the rule, perhaps without exception, in sexual generation, and opposes the view of the spermists, that the embryo comes from the male element, for the development of which the female furnishes only the nidus, and that of the ovulists, that the embryo is derived entirely from the female, the male principle affording only the requisite stimulus to development. As a doctrine or theory, one form of syngenesis supposes every germ to contain the germs of all generations to come, and is opposed to *epigenesis*.

The theory of *syngenesis*, which considers the embryo to be the product of both male and female, is as old as Empedocles. *G. H. Lewes*, Aristotle, p. 363.

Growth, therefore, was, on this hypothesis [of Buffon's], a process partly of simple evolution, and partly of what has been termed *syngenesis*. *Huxley*, Evol. in Biol.

It is characterized by a climbing shrubby stem, stamens connate into a prismatic body, and coherent ovaries with anatropous basilar ovules solitary in their one or two cells. The fruit is a mucilaginous syncarp, composed of coalescent berries with black obovoid seeds without albumen, and mainly composed of the large embryo. There are about 10 species, natives of tropical America, from the West Indies and Mexico to Brazil. They are irregular climbers, rooting at the nodes, and there bearing long-stalked leaves, the earlier arrow-shaped, the later three- to nine-divided. The flowers are produced on a monœcious spadix, the staminate part club-shaped and much longer, borne in a still longer spathe, which consists of an ovoid persistent tube and a shell-shaped, finally reflexed, and deciduous upper section. *S. auritum*, long cultivated under the name *Caladium*, is known in Jamaica as *fivefinger*, from its five-parted leaves.

Why should you have a *Synod*, when you have a Convocation already, which is a *Synod?*
Selden, Table-Talk, p. 108.

Twice a year, in accordance with the canonical institutions of Christian antiquity, had it been ordered of old in an English Council that every bishop and his priests should meet together in *synod;* the common form of proceeding which was used in these early clerical gemotes is believed to be still extant. *R. W. Dixon*, Hist. Church of Eng., xix.

It consists of several metropolitans and other prelates and officials — the chief procurator of the synod representing the czar. It was instituted by Peter the Great in 1721, to supply the place of the patriarch of Moscow. The last patriarch had died about 1700, and Peter would not allow the appointment of a successor,

thinking the power of the patriarchal office too great. The orthodox national church of the kingdom of Greece is also governed by a synod of archbishops and bishops, independent of any patriarch.—**Mixed synod**, a synod composed of clergy and laity.—**Robber synod.** Same as *Latrocinium*, 2.

2. A word of one language which corresponds in meaning with a word in another language. See *heteronym*, 2, *paronym*, 2, and the quotation from Camden under *synonymize*.—3. In *nat. hist.*, a systematic name having the same, or approximately the same, meaning or application as another which has superseded it; a technical name which, by the rules of nomenclature, is not tenable. The question of the acceptance of a generic or a specific name depends upon the law of priority. (*a*) Botanists take 1753, the year of the publication of Linnæus's "Species Plantarum," as the starting-point for both genera and species, since in this publication binomials were for the first time systematically adopted. The naming of a botanical species consists in conferring upon it two appellations, a generic and a specific; and adequate publication consists in issuing a printed diagnosis sufficient to identify the plant with certainty. The earliest name conferred after the above date is the name by which, according to the law of priority, the plant must be known, providing, of course, that the classification is correct; and it is held that a strict adherence to this rule is essential in order to a stable systematic nomenclature. Since plants have often been placed in a wrong genus, the question arises whether the absolutely first specific name is to be retained, or the first that was used with the right genus name; the former is the accepted alternative. The names thus discarded are called *synonyms*, though in a broader sense all the names from which the selection is made are synonyms. On account of unsettled usage synonyms must often be quoted. In obedience to the law of priority, Nuttall's name *Carya*, by which the hickory has been known since 1818, becomes a synonym of *Hicoria*, the earlier name of Rafinesque; *Calycanthus* gives way to *Butneria*; *Mentha viridis* of Linnæus, 1763, to his *Mentha spicata*, 1753; *Trollius Americanus* of Muhlenberg to *T. laxus* of Salisbury; etc. (*b*) Zoölogists usually adopt a different date. In England and on the continent of Europe this is generally 1766, the date of the twelfth edition of the "Systema Naturæ" (with an express exception in favor of the genera (not the species) of Brisson, 1760); American zoölogists nearly all start from 1758, the date of the tenth edition of the work named. This difference of dates is the chief incompatibility of two schools which have become known as the *English* and the *American*, neither of which has thus far yielded the point to the other. The former school contends that 1766 (the date of the last edition of the "Systema," revised by the author himself) represents the completion of the Linnean binomial system in zoölogy, the earlier editions having been but provisional or tentative; the latter school maintains that 1758 is the date when that system was first formally and consistently applied to zoology. In practice the whole matter of synonyms is extremely complicated by various considerations other than the single question of priority in any given case—as, for example, the adequacy or exclusive pertinence of the diagnosis upon which a name rests; recognizability of a description; acceptation of a name in a wide or a narrow sense by different authors; transference or cross-use of a name by different authors; erroneous identification and consequent wrong applications of a name; rejection of a name for one of several different reasons and introduction of another name in its stead; the question whether use of a name in botany precludes its subsequent use in zoölogy (and conversely); the question whether the same name can be an onym in more than one of the numerically enormous orders of insects; and, particularly, the biological question (a matter necessarily of expert opinion) of what constitutes a genus, species, subspecies, etc. To all the above considerations (besides which various others could be adduced) is to be added especially, in accounting for the vast number of synonyms which encumber zoölogical nomenclature, the incessant redescription and renaming of species and genera in ignorance of the fact (or ignoring the fact) that they had been named before, or mistaking them for valid when they are not. One singular class of synonyms is merely verbal, arising from corrections of malformed words, which, when properly respelled, are seen to be literally identical with other names from which they had appeared different by the misspelling; and with this class of synonyms is related another, arising from a mere difference in termination (as of gender, for example, *Picus* and *Pica*), inflection, etc. (as *Synodus*, *Synodon*, *Synodontus*. *Synodontis*). Literal quibbles of this sort have proved so frequently vexatious that the American school has declared that a word must subsist precisely as originally printed, no matter how malformed or misspelled, unless a typographical error be manifest, and that any two words which are differently spelled are tenable as different names, if the distinction be anything more or other than mere change of termination (as *-us*, *-a*, *-um*, or *-ites* and *-itis*, as distinguishing grammatical gender). Irrespective of the law of priority, and also of any such moot points as are above cited, the rules of nomenclature require (1) that no specific or subspecific name shall be used twice in the same genus; and (2) that no generic name, or name of any higher group, shall be used twice in the animal kingdom. There is thus, theoretically, but a single onym (tenable binomial designation) of every species, and a single onym of every genus or higher group—all other designations being in every case synonyms. Practically, however, the case is far from any such simplicity and uniformity; alternative technical names incessantly recur in the literature of zoölogy; and the synonymy of numberless species, genera, etc., is in almost inextricable confusion. The number of synonyms in zoölogy vastly exceeds that of the onyms; most species which have long been known have acquired a larger number of New Latin synonyms than of English names; very many have been placed in a dozen or more different genera, and have been described under as many different specific names—the various combinations of which generic and specific designations are a third source of uncounted synonyms. Such uncertainty and inconvenience have resulted from all these nomenclatural vagaries that some zoölogists do not hesitate to ignore the fundamental law of priority, and continue to call a species by the technical name by which it has been oftenest called already. Such consensus of the nomenclators has at least the advantage of presenting better-known instead of less-known names.

To found any harmonic theories on the *synonymity* of tones in any temperament, when there is known to be no *synonymity* in nature, and when the artificial *synonymity* thus engendered varies from temperament to temperament, is only comparable to deducing geometrical conclusions from the mere practical construction of figures.
Ellis, in Helmholtz's Sensations of Tone, App., p. 660.

Selden, Illustrations of Drayton's Polyolbion, ii.

4. A system of synonyms; a collection of synonyms; also, the study of synonyms; the use of synonyms in expressing different shades of meaning; the discrimination of synonyms; especially, in *nat. hist.*, the sifting of synonyms to determine the onyms. In botany and zoölogy the synonymy of a species of plant or animal, in the concrete, is a list of the several different names which have been applied to it by its various describers or classifiers, implying on the synonymist's part the discrimination not only of the synonyms of the species, but of the homonyms of related species, for the especial purpose of determining the onym of each species. Thus, *Falco fuscus* and *Falco obscurus* may be synonyms of one and the same species of falcon, yet *Falco fuscus* may be a homonym of two different species of falcon, and it may be that neither name is the onym of either of these species. Synonymy in natural history has become of late years so extensive and so intricate that probably no naturalist has mastered the subject beyond the line of some one narrow specialty. Synonymatic lists for single species extending over several pages of an ordinary book are occasionally met with. See *synonym,* 3.

The inconveniences arising from the want of a good Nomenclature were long felt in Botany, and are still felt in Mineralogy. The attempts to remedy them by *Synonymies* are very ineffective, for such comparisons of synonymes do not supply a systematic nomenclature.
Whewell, Philos. of Inductive Sciences, I. p. lxxv.

Yet the Tübingen professors and our Liberal newspapers must surely have something to go upon when they declare that the Jesus of the Fourth Gospel speaks quite differently from the Jesus of the *Synoptics,* and propound their theory of the Gnostic philosopher inventing, with profoundly calculated art, his fancy Gospel.
M. Arnold, God and the Bible, vi. § 5.

The real difference between John and the *Synoptics,* on this most decisive point, amounts to this: while these last have handed down to us but a single example of this form of language, John has preserved for us several examples selected with a particular purpose.

Such tables often proceed upon the dichotomous plan of presenting in succession alternatives of two (or more) characters, only one of which the specimen in hand should exhibit, as the "ovary inferior" and "ovary superior" in case of a plant; but the tabulation may be made in any way which best subserves the desired purpose in different cases. Some are natural analyses, others wholly artificial; the former are the more important and really instructive, the latter the most convenient and immediately helpful. Some combine these incompatible features as far as possible; and all are constantly used in systematic treatises, manuals, and text-books. They are often called *keys.*

Puttenham, Arte of Eng. Poesie, p. 130.

Geometrical deduction (and deduction in general) is called *synthesis*, because we introduce, at successive steps, the results of new principles. But in reasoning on the relations of space we sometimes go on separating truths into their component truths, and these into other component truths, and so on; and this is geometrical analysis.

Science turns her back on the subject, and the universities dismiss Art from the category of studies, and pass it over mainly to the painters to discourse on, ignoring the psychological law that no mind can be productively analytical and synthetical at the same time, and the artist, being perforce a *synthesist*, cannot be expected to analyse the art which he is, if a true artist, occupied in building.
New Princeton Rev., II. 24.

2. In *gram.*, characterized by synthesis, or the combination of radical and formative elements into one word, as distinguished from their maintenance in separate words, which is *analytic*. Thus, *man's* is synthetic, *of man* is analytic; *higher* is synthetic, *more high* is analytic; *loved* is synthetic, *did love* is analytic; and so *amabitur* (Latin) and *will be loved*. The epithet is used both of single formations, like these, and of classes of expressions; also of a whole language, or a period or class of languages, according as expressions of one or of the other class prevail in each case.

3. In *biol.*, of a general or comprehensive type of structure; combining in one organism characters which are to be specialized in several different organisms in the course of evolution; generalized, not specialized; undifferentiated. Thus, the *Symphyla* are a synthetic type, as combining characters of the classes *Myriapoda* and *Hexapoda*. Since the general course of evolution is from generals to particulars, or from generalization to specialization, synthetic forms are mostly low or primitive, and less fully illustrated by recent or living than by early and extinct organisms. Most fossil types are synthetic in comparison with existent forms of which they are ancestral.—**Synthetic geometry,** geometry treated without algebra, or at least without coördinates: opposed to *analytical geometry*. Modern synthetic geometry, which has been almost altogether the fruit of the nineteenth century, resembles the geometry of the Greeks, but far surpasses it in power and beauty. See *geometry*.—**Synthetic judgment** or **proposition,** a judgment professing to contain matter of fact, and not mere explication of what is implicitly contained in the idea of the subject.—**Synthetic method.** See *method*.—**Synthetic philosophy,** the philosophy of Herbert Spencer: so called by himself, because it is conceived as a fusion of the different sciences into a whole. See *Spencerianism*.

In its simplest form it consists of a small cylindrical tube with an air-tight piston fitted with a rod and handle. The lower end of the cylinder terminates in a small tube; on this being immersed in any fluid, and the piston then drawn up, the fluid is forced into the body of the cylinder by the atmospheric pressure, and by pushing back the piston to the bottom of the cylinder the contained fluid is expelled in a small jet. The syringe is used by surgeons and others for washing wounds, for injecting fluids into the body, and for other purposes. A larger form is used for watering plants, trees, etc. The syringe is also used as a pneumatic machine for condensing or exhausting the air in a close vessel, but for this purpose two valves are necessary.

3. In *anat.*, the Eustachian tube.—4. In *ornith.*, the voice-organ of birds; the lower larynx, situated at or near the bifurcation of the trachea into the bronchi, and serving to modulate the voice, as in singing. This is usually a more complicated structure than the larynx proper (at the top of the trachea), and so differently constructed in different birds that it affords characters of great significance in classification. The highest group of *Passeres* (namely, the suborder *Oscines*, which contains the singing birds) is signalized by the elaboration of this musical organ, especially with reference to its intrinsic musculation. A few birds have no syrinx; some have one, yet without intrinsic muscles; in some the syringes are wholly *bronchial*, and consequently paired; in others the syrinx is wholly *tracheal*, and single. But in nearly all birds the syrinx is *bronchotracheal*, and results from a special modification of the lower end of the trachea and upper end of each bronchus. The lowermost tracheal ring, or a piece composed of several such rings, is enlarged and otherwise modified, and crossed by a bolt-bar (see cut under *pessulus*), which separates the single tracheal tube into right and left openings of the bronchi. A median septum rises from the pessulus into the trachea, between the two bronchial orifices, and the free upper margin of this septum, called the *semilunar membrane*, forms the inner lip of a rima syringis, whose outer lip is a fold of mucous membrane from the opposite side of each bronchus. These membranes are vibratile in the act of singing, and constitute vocal cords. Several upper bronchial half-rings, enlarged and otherwise modified, are completed in circumference by a single continuous membrane, the *internal tympaniform membrane*, which is attached to the pessulus above. The syrinx is actuated by a pair, or several pairs, of intrinsic singing-muscles, called *syringomya*, which vary much in different birds in their attachments as well as in their number. (See *song-muscle.*) In the *Oscines* at least five pairs are recognized, though their nomenclature is by no means settled, owing to their description under different names by different authors, and to the difficulty of homologizing the individual muscles under their many modifications in different birds. The insertion of the syringomya into the ends and not into the middle of the bronchial half-rings is characteristic of the true *Oscines.* See *Acromyodi*, *Mesomyodi.*

Those of *Microdon* are found in ants' nests, while those of *Volucella* are parasitic in the nests of bumblebees. About 2,000 species are known, of which 300 are North American (north of Mexico), while about 550 are European. > Every work, both of nature and art, is a *system;* and, as every particular thing, both natural and artificial, is for some use or purpose out of and beyond itself, one may add to what has already been brought into the idea of a *system* its conduciveness to this one or more ends. Let us instance in a watch. *Butler*, Analogy.

> A Natural *System* is one which attempts to make all the divisions natural, the widest as well as the narrowest, and therefore applies no characters peremptorily. . . . An Artificial *System* is one in which the smaller groups (the Genera) are natural, and in which the wider divisions (Classes, Orders) are constructed by the peremptory application of selected Characters (selected, however, so as not to break up the smaller groups). *Whewell*, Philos. of Inductive Sciences, I. p. xxxii.

> For a *system*, in the most proper and philosophic sense of the word, is a complete and absolute whole.

A system the metrical form of which is repeated once or oftener in the course of a poem is called a *strophe*.

9. In *biol.*: (*a*) An assemblage of parts or organs of the same or similar tissues. The principal systems of the body in this sense are the *nervous*, both cerebrospinal and sympathetic; the *muscular*, both voluntary and involuntary; the *osseous*, including the cartilages as well as the bones of the skeleton; the *vascular*, including the *blood-vascular* and *lymphatic* or absorbent; the *tegumentary;* the *mucous*, including the mucous membranes; and the *serous*, including the serous membranes. These systems may be subdivided, as the vascular into the blood-vascular and lymphatic systems; or some of them may be grouped together, as when the *connective-tissue* system includes the bones, cartilages, ligaments, tendons, and general areolar or cellular tissues of the body. Hence—(*b*) In a wider sense, a concurrence of parts or organs in some function. Most if not all such systems act physiologically by the concurrence of several other lesser systems: as, the *digestive* system; the *respiratory* system; the *reproductive* system. Hence—(*c*) In the widest sense, the entire body as a physiological unity or anatomical whole: as, to take food into the *system;* to have one's *system* out of order. (*d*) In *ascidiology*, the cœnobium of those compound tunicates which have a common cloaca, as the *Botryllidæ*. *Von Drasche*, 1883.—**10.** A division of the second order in the classification of sedimentary deposits: as, the Devonian *system*, the Silurian *system*. 11. In *nat. hist.*: (*a*) In the abstract, classification; any method of arranging, disposing, or setting forth animals and plants, or any series of these, in orderly sequence, as by classes, orders, families, genera, etc., with due coördination and relative subordination of the several groups; also, the principles of such classification; taxonomy: as, the morphological *system;* a physiological *system*. There is but one adequate and natural system, namely, that which classifies animals and plants by structure alone, according to their degrees of genetic relationship, upon consideration of descent with modification in the course of evolutionary processes; it is the aim of every systematist to discover this true taxonomy and set it forth by classificatory methods. (*b*) In the concrete, any zoölogical or botanical classification; any actual arrangement which is devised for the purpose of classifying and naming objects of natural history; a formal scheme, schedule, or inventory of such objects, or a systematic treatise upon them: as, the Linnean or artificial *system* of plants; Cuvier's *system* of classification; the quinarian *system*. Such systems are very numerous, and no two agree in every detail either of classification or of nomenclature; but all have in view the same end, which is sought to be attained by similar methods, and upon certain principles to which most naturalists now assent.—**Abkari system.** See *abkari*.—**Action of a moving system.** See *action*.—**Adjunct system,** a system of linear equations whose coefficients are the corresponding minors of the determinant of a primitive system.—**Allotment, American, asymmetric system.** See the qualifying words.—**Ambulacral system.** Same as *water-vascular system*.—**Apolar system,** the aggregate of surfaces of a given order whose polars with reference to a given surface are indeterminate.—**Banting system.** See *bantingism*.—**Barrier, block, blood-vascular, bothy system.** See the qualifying words.—**Binary system.** See *binary classification*, under *binary*.—**Brunonian system,** an old medical doctrine formulated by Dr. John Brown, a Scottish physician. It involved two things—the use of the chiroplast, a mechanical contrivance for holding the pupil's hands in a correct position at the keyboard, and the simultaneous instruction of several pupils at as many pianofortes. The chiroplast had drawbacks which have led to its being discarded, but the plan of class instruction is in use to some extent in all music-schools.—**Lot, Macleayan, male, mark, mercantile, metamorphotic, metayer, military, moiety, muscular, natural, nervous, octave system**. Emmons in 1842 for an important series of rocks determined by him as older than the Silurian and carrying fossils of greater age than any before recognized: equivalent to *Lower Cambrian* of Sedgwick, *Primordial* of Barrande, and *Cambrian* of most geologists. These rocks are greatly changed by metamorphism, but, following Emmons's original discovery, have been found to contain an extensive fauna. Their character and value have been the subject of prolonged controversy, but it is now conceded that Emmons was the first to recognize the existence of the primordial fauna and the rock system to which it appertained.

But *system* is often used for *method*; *method* is not used for *system*. *System, Range, Chain*, in *orography*, as used by physical geographers writing in English, are nearly the same: thus, we find the "Appalachian chain" frequently called "Appalachian range" or "ranges," and also "Appalachian system." *System* is the more comprehensive term. All the *ranges* which go to make up a complex of mountains sufficiently nearly a unit, as popularly designated, to be embraced under one name, may be called a *system*: thus, the *ranges* of the Great Basin, some twenty or more in number, may properly all be classed together as forming the Great Basin "mountain system," or simply "system."

As thus defined, the Appalachian Region, *System*, or complex of *ranges*, extends from the promontory of Gaspé, in a mean direction of northeast and southwest, to Alabama—a distance of about 1,300 miles—where it disappears entirely, becoming covered by the much more recent geological formations, which form a broad belt along the Gulf of Mexico, and extend far up the Mississippi Valley. *J. D. Whitney*, The United States, p. 32.

Ancient metricians varied in their use of this term. Some use it regularly for a dipody or (dipodic) measure. Others call a tautopody, or double foot, a dipody, but a combination of two different feet a syzygy. Some, accordingly, giving the name *syzygy* to tetrasyllabic feet (regarded by them as composed of two dissyllabic feet), speak of an iambic or a trochaic line as measured by dipodies, but an Ionic line as measured by syzygies—that is, by single Ionics considered as combinations of trochees and pyrrhics. A peculiar use is the restriction of the term *syzygy* to compound feet of five or six syllables. **3.** In *alg.*, a linear function in the variables. See *syzygetic*.—**4.** In *zoöl.*, the conjunction of two organs or organisms by close adhesion and partial concrescence, without loss of their identity; also, the thing so formed, or the resulting conformation; a syzygium: a term variously applied. (*a*) Zygosis or conjugation, as observed in various protozoans and other low organisms. See *conjugation*, 4. *Diplozoön*, and *diporpa*. (*b*) Suture, or fixed articulation, of any two joints of a crinoid ray, or the joints thus sutured, with partial obliteration of the line of union.

Syzygy of *Diplozoön paradoxum*.

The first of the brachial joints [in the *Pentacrinus asteria*]—that is to say, the joint immediately above the radial axillary—is, as it were, split in two by a peculiar kind of joint, called by Müller a "*syzygy*." All the ordinary joints of the arms are provided with muscles producing various motions, and binding the joints firmly together. The *syzygies* are not so provided, and the arms are consequently easily snapped across where these occur.
Sir C. Wyville Thomson, Depths of the Sea, p. 440.

Epirrhematic syzygy, in *anc. pros.*, the last four parts of the parabasis—that is, the strophe or ode, epirrhema, antistrophe or antode, and antepirrhema: the choric as distinguished from the monodic parts of the parabasis.

T

★ 1. The twentieth letter and sixteenth consonant of the English alphabet. Of the Phenician alphabet the corresponding sign was the twenty-second and last; what follows *t* in Greek and Latin, and also in our own scheme, is the result of successive additions made to the system borrowed from Phenician. (See the several letters below.) The comparison of forms (compare *A*) is as follows:

Egyptian. Hieroglyphic. | Hieratic. | Phenician. | Early Greek and Latin.

The value of the sign has been practically the same through the whole history of its use; it denotes the surd (or breathed) mute (or check) produced by a complete closure (with following breach or explosion) between the tip of the tongue and a point on the roof of the mouth either close behind or not far from the bases of the upper front teeth. Its corresponding sonant or voiced mute is *d*, and its nasal is *n* (see these letters). They are oftenest called *dental* or teeth-sounds, though the teeth have really no part in their production; hence also, and better, *lingual*, or *front lingual*, or *tongue-tip*, etc. They are much more common elements of our utterance than either of the other two classes, palatal (*k*, *g*, *ng*) or labial (*p*, *b*, *m*); they constitute, namely, about 18 per cent. of the sounds we make (*t* nearly 6 per cent., *d* nearly 5, *n* nearly 7), against palatal 4 per cent., and labial 6½. A sound which our ears would at once recognize and name as a *t*-sound is producible in other positions of the organs than that described above — namely, at points further back on the roof of the mouth, and with parts of the tongue behind the tip, and even of its under surface. Hence the occurrence in some languages of more than one *t*, distinctly recognized as separate members of the spoken alphabet (so two in Sanskrit, etc., and even four in Siamese); our own *t* also which forms the first part of the compound *ch* (= *tsh*) is slightly but constantly different from our *t* elsewhere. As in many other languages (and partly by direct inheritance from French, and even from later Latin, alterations), the *t* in English shows a tendency to become palatalized and converted into a sibilant when followed by palatal sounds, as *i*, *e*, *y*. Hence, in many situations, it combines with such sounds, either regularly or in rapid utterance, producing the *ch*-sound, as in *question*, *mixture* (compare the corresponding conversion of *s* to *sh*, under *S*); and even, in a great number of words having the endings *-tion*, *-tious*, *-tial*, etc., it becomes a sibilant and makes the *sh*-sound, as in *nation*, *factious*, *partial*, etc. *T* also, like others of our consonants, frequently occurs double, especially when medial: thus (from *fit*) *fitted*, *fitter*, *fitting*. With *h*, *t* forms the digraph *th*, which has the position and importance of a fully independent element in the alphabet, with a double pronunciation, surd and sonant (or breathed and voiced): surd in *thin*, *breath*; sonant in *this*, *breathe* — both as strictly unitary sounds as *t* and *d*, or *s* and *z*. They are related with *t* and *s*, etc., as tongue-tip sounds, especially with *s* and *z* as being fricative and continuable; but they are of closer position than the latter, the closest that can be made without actual stoppage of the breath, and are usually formed with the tongue thrust further forward, against or even beyond the teeth: hence their substitution for *s* and *z* by persons who lisp. In regard to their grade of closure, they are akin to *f* and *v*, and belong in one class with these (oftenest and best called *spirants*). As an *f* comes in part from an aspirated *p*, or *ph*, so also the *th*-sounds from an aspirated *t*; and in this way they have obtained their usual representation: the Greek *θ*, which was an aspirated *t* (that is, a *t* with separately audible *h* after it), was written in Latin with *th*, and then, when the aspirate came to be pronounced as a spirant, this was continued in use as representative of the latter. And in this case the Latin digraph has crowded out of English use the sign (or rather the two signs) which in Anglo-Saxon represented the *th*-sounds — namely, Þ, Ð — much to the detriment of our present alphabet. Of the two *th*-sounds, the sonant (or *this* and *breathe* sound) is much the more frequent, owing chiefly to the constant recurrence of the pronominal words, particularly *the*, in which it is found; it is nearly 4 per cent. of our utterance, while the surd (or *thin* and *breath* sound) is less than two thirds of one per cent. In the phonetic history of the Germanic part of our language, *t* regularly and usually (when special causes do not prevent) comes from an older *d*; and, on the other hand, *th* from an older *t*: examples for *t* are *two* corresponding with *duo*, *eat* with *ad* or *ed*; for *th*, *thou* = *tu*, *three* = *tri*, *beareth* = *fert*; for both together, *that* = *tad*, *tooth* = *dent*.

Specifically — (*a*) A flap, strap, or latchet of a shoe. (*b*) The tag at the end of a shoe-lace. (Leach, 1819), < *Tabanus* + *-idæ*.] A large family of biting flies, of which *Tabanus* is the typical genus; the gadflies, breezes, or clegs, having the third joint of the antennæ annulate and without a distinct bristle. The proboscis of the female is adapted for piercing, and inflicts a painful although not irritating wound. The male does not bite. They fly with extraordinary speed, and the swiftest horse cannot elude them. The spindle-shaped brown or black eggs are attached in groups to plants or are placed in the earth, and the larvæ are either aquatic or live in damp earth. They are predaceous, and feed upon snails or small insects. The young larvæ of many species penetrate beetles and other larvæ, and remain within until they have entirely consumed them. (Vulgate) the Jewish tabernacle, dim. of *taberna*, a hut, shed, booth; from the same root as *tabula*, a table, tablet: see *tavern*, *table*.] 1. A tent; a pavilion; a booth; a slightly constructed habitation or shelter, either fixed or movable; hence, a habitation in general, especially one regarded as temporary; a place of sojourn; a transient abode.

Prov. xiv. 11.

Let us make here three *tabernacles*, one for thee, and one for Moses, and one for Elias. Mat. xvii. 4.

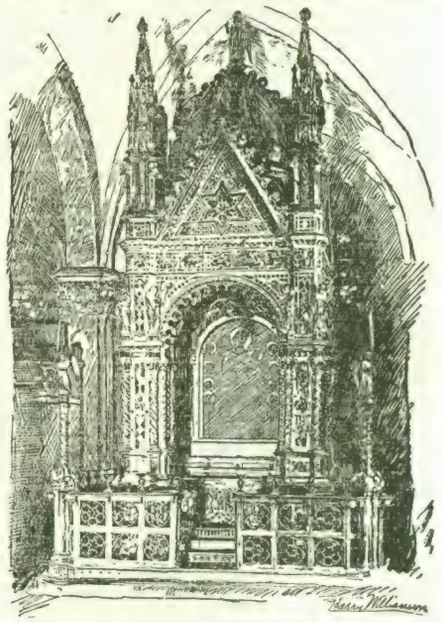
2. In *Biblical phraseology*, the human frame as the temporary abode of the soul, or of man as a spiritual immortal being.

Yea, I think it meet, as long as I am in this *tabernacle*, to stir you up by putting you in remembrance; knowing that shortly I must put off this my *tabernacle*, even as our Lord Jesus Christ hath shewed me. 2 Pet. i. 13, 14.

3. In *Jewish hist.*, a tent constructed to serve as the portable sanctuary of the nation before its final settlement in Palestine. This "tabernacle of the congregation" is fully described in Ex. xxv.–xxvii. and xxxvi.–xxxviii. It comprised, besides the tent, an inclosure or yard, in which were the altar of burnt-offerings and the laver. The tabernacle proper was a tent divided into two chambers by a veil—the inner chamber, or holy of holies, containing the ark of the covenant and the mercy-seat, and the outer chamber the altar of incense, the table of showbread, and the golden candlestick. The tabernacle was of a rectangular figure 45 feet by 15, and 15 feet in height. The court or yard was 150 feet in length by 75 feet, and surrounded by screens 7½ feet high. The people pitched round the tabernacle by tribes in a fixed order during their wanderings, and the pillar of cloud and of fire, denoting Jehovah's presence, rested upon it or was lifted from it according as they were to remain stationary or were to go forward. After the arrival in the promised land it was set up in various places, especially at Shiloh, but gradually lost its exclusive character as the center of national worship before the building of Solomon's temple, in which its contents were eventually placed.

And he spread abroad the tent over the *tabernacle*, and put the covering of the tent above upon it. Ex. xl. 19.



And they brought up the ark [to the temple built by Solomon], and the *tabernacle* of the congregation [tent of meeting, R. V.], and all the holy vessels that were in the *tabernacle*, these did the priests and the Levites bring up. 2 Chron. v. 5.

Hence—4. A place or house of worship; especially, in modern use, an edifice for public worship designed for a large audience: often now the distinctive name assumed for such an edifice.

The shed in Moorfields which Whitefield used as a temporary chapel was called "The *Tabernacle*"; and, in the scornful dialect of certain Church-of-England men, Methodist and such-like places of worship have, since then, been known as *tabernacles*.
F. Hall, False Philol., p. 24, note.

5. A receptacle for the reserved eucharist; especially, a constructional receptacle for this purpose, containing the pyx. The tabernacle, as now commonly seen in Roman Catholic churches, is a recess with a door, placed over and behind the high altar or one of the side altars, usually having over it a cross or crucifix with a design in relief, the whole surmounted by a canopy. In earlier times a movable ark, or usually a suspended dove (columba) or a tower, held the eucharist or the vessel containing it. In England the general medieval custom was to place the sacrament in an ambry on one side of the sanctuary or in the sacristry. The tabernacle is a later development of the ark or ambry as a permanent construction over the high altar and surmounted by a canopy or ciborium, often in the spire-like shape developed from the older tower; hence the name *tabernacle* is often given especially to this canopy or to canopies of similar appearance.

Among the ancient Jews it

lasted eight days, during which all the people gathered at Jerusalem and dwelt in booths. (See Lev. xxiii. 34–36; Num. xxix. 12–39.) Among the modern Jews the feast has been prolonged one day.

Tabernæmontana (tā-bėr″nē-mon-tā'nă), *n.* [NL. (Plumier, 1703), named after Jacobus Theodorus *Tabernæmontanus*, a German physician and botanist (died 1590).] A genus of dicotyledonous plants, of the family *Apocynaceæ* and tribe *Plumerieæ*, type of the subtribe *Tabernæmontaninæ*. It is characterized by cymose flowers, a calyx furnished at the base of its five lobes with a continuous or interrupted ring of glands, and a fruit of two many-seeded berries or fleshy follicles which are large and globose or smaller and oblique or recurved. There are about 50 species, all natives of tropical America. They are trees or shrubs, commonly smooth, bearing opposite thin or coriaceous feather-veined leaves. The small cymes of white or yellowish salver-shaped flowers are terminal or variously placed, but not truly axillary. The smooth or three-ribbed pulpy fruit contains several or many ovoid or oblong seeds with fleshy albumen: in several species it is ornamental. Instead of the acrid, drastic, and poisonous milky juice of most related genera, many species of *Tabernæmontana* secrete a bland and wholesome fluid, sometimes useful as a nourishing drink, as in *T. utilis*, the cow-tree or hya-hya of British Guiana, which yields a thick, sweet, white liquid, made somewhat sticky by the presence of caoutchouc. This species also yields a soft white wood and a medicinal bark. A large number of old-world species, formerly referred to *Tabernæmontana*, belong to other genera, among which *Ervatamia coronaria*, known as *Adam's apple* or *East Indian rose-bay*, is sometimes cultivated under glass, forming small evergreen trees, and also naturalized in tropical Asia from the Cape of Good Hope. Several other species are cultivated under glass for their large fragrant flowers and ornamental deep-green leathery leaves. *Conopharyngia crassa*, the kpokpoka-tree of Sierra Leone, produces a fiber there made into a cloth known as *dodo-cloth*.

4†. In *music*: (*a*) The system of rules for the poetry of the mastersingers. (*b*) Musical notation in general. (*c*) A form of musical notation for various instruments, like the lute, the viol, the flute, the oboe, or the organ, used in Europe from the fifteenth to the beginning of the eighteenth century. It differed from the more general staff-notation in that it aimed to express not so much the pitch of the tones intended as the mechanical process by which on the particular instrument those tones were to be produced. Tablature, therefore, varied according to the instrument in view. In the case of the lute, for example, a horizontal line was usually drawn for each string, forming a kind of staff; and letters or numerals were placed on these lines, indicating not only which strings were to be touched, but at what frets they were to be stopped. Various arbitrary signs were also used instead of letters or numerals, or in combination with them. Music thus noted was said to be written *lyra-way*, in distinction from *gamut-way* (in the staff-notation). In the case of wind-instruments, like the flageolet, points or dots were often placed on horizontal lines to indicate which finger-holes were to be closed to produce the required tones. In the case of the organ, notes were often written out by their letter-names. In all these systems and their numerous variants, marks were added above or below to indicate the desired duration of the tones, the place and duration of rests, and various details of style. Tablature had obvious advantages as a notation for particular instruments. Various technical marks now used are either derived from it or devised on the same principle. The tonic sol-fa notation, that of thorough-bass, and the little-used systems of numeral or character notes are essentially analogous to it. Also *tabulature*.

This arrangement produces a motion of the table analogous to that of hand-rubbing. For this movable frame a hinged or sliding bracket is now often substituted.—**Pillar-and-claw table,** a table with a central support like a pillar, to the top of which the slab or top of the table is usually hinged: the pillar rests on three, four, or more feet, originally carved to represent the paws and claws of animals.—**Pythagorean table.** See *Pythagorean*.—**Round table.** (*a*) A circular table around which persons of unequal rank formerly sat at meals on special occasions, in order that social discriminations might be set aside for the time: in distinction from the ordinary long table, at which comparative rank was indicated by the distance of the guest's seat from the top or head, or above or below the salt. table-land (tā′bl-land), *n.* An elevated and generally level region of considerable extent; a plateau. Both *table-land* and *plateau* are in common use among physical geographers with essentially the same meaning. Chains of mountains frequently rise from or encircle table-lands. The region of the most extensive table-lands of the world is central Asia; the Pyrenees, the Alps, and the Caucasus, on the other hand, are mountain systems characterized by the absence of plateaus. The vast area embraced between the Rocky Mountains and the Sierra Nevada and Cascade ranges is a plateau region. That part north of the Great Basin has been called the "Northern, or Columbian, Plateau region of the Cordilleras," and that south of the Great Basin the "Southern or Colorado Plateau"; and this is a region of great interest, both from its scenery and from its geological structure.

The most important tacamahac is derived from *Calophyllum Inophyllum*, of the East Indies, Polynesia, etc. (see *tamanu*), of which the *C. Tacamahaca* of Madagascar and the Isle of Bourbon is a variety. The resin is of a greenish-yellow color, liquid at first, but hardening into a brittle aromatic mass soluble in alcohol and ether. It exudes spontaneously or through incisions from the bark and roots. A similar gum is afforded by *C. Galba* in the West Indies. The South American tacamahac is the product of *Terebinthus tomentosa* (*Bursera tomentosa* of Triana and Planchon) and *T. excelsa* (*Bursera excelsa* of Engler), of *Protium heptaphyllum*, and perhaps of some other trees. The buds of *Populus balsamifera* and *P. candicans* (see def. 2) are varnished with a resin which may be included under this name, occasionally used in the place of turpentine and other balsams. Tacamahac is sometimes used for incense, was formerly an esteemed internal remedy, and may still be somewhat used in plasters, but is very little in the market. In this sense often *tacamahaca.*

The numerous inner bracts are long, filiform, and pendulous, and have been erroneously regarded as sterile pedicels. *T. pinnatifida*, the pia-plant or Otaheite saleplant, yields a nutritious starch, the South Sea arrowroot. (See *pia*2.) Its leafstalks are boiled and eaten in China and Cochin-China; in Tahiti they are dried and plaited into bonnets. Other species, thought to be valuable as starch-plants, occur in Australia, India, Madagascar, Guinea, and Guiana.

The mercury in the tube descends at the same time, and the degree of this descent is measured by a scale attached to the tube. The velocity of the machine being lessened, the mercury rises in the center, causing a proportionate rise in the tube. (*b*) An instrument for measuring the velocity of running water in rivers, etc., as by means of its action on a flat surface connected with a lever above the surface carrying a movable counterpoise, or by its action on the vanes of a wheel, whose revolutions are registered by a train of wheelwork; a current-measurer. "Chambers's Cyclopædia," 1741, describes it as a very lustrous silk, sometimes checkered or flowered, and sometimes striped with gold and silver. The posterior extremity of an animal, in any way distinguished from the rest of the body; the hind end or hinder part of the body, opposite the head; especially, the coccygeal region or caudal appendage, when prolonged beyond the rest of the body. More particularly—(*a*) In mammals generally, the cauda, which may be a mere stump, or a slender appendage longer than the rest of the body. It consists of a more or less numerous series of coccygeal vertebræ with usually elongated bodies and reduced or aborted processes or neural canal, covered with flesh, etc., and enveloped in integument frequently hairy, like the rest of the body. These vertebræ resemble the joints or phalanges of a finger, and the whole organ is usually flexible, and may be prehensile, like a hand. In mammals without hind limbs, as cetaceans, the tail is the small or tapering hind part of the body ending in the flukes, or the flukes themselves. (*b*) In birds, the tail-feathers collectively. (*c*) In reptiles, the prolongation of the body behind the anus, of whatever character. In reptiles with legs, as crocodiles, turtles, most lizards, and nearly all batrachians, the tail obviously corresponds to the part so named in mammals; it is often extremely long, slender, flexible and lash-like, and generally fragile. It may be sometimes replaced by a new growth when broken off. In serpents and other limbless reptiles the tail is marked by the position of the anus as indicating the end of the body-cavity; it is solid and muscular, and often differently scaled from the parts in advance of it. (*d*) In fishes (as in cetaceans, above), the tail is the postabdominal part of the body, behind the anus, usually tapering and ending in the caudal fin; also, this fin itself in some cases. In such fish-like vertebrates as the rays, the tail is often a long, slender, whip-like appendage, well distinguished from the rest of the body. See cuts under *fish* and *diphycercal*. (*e*) In crustaceans, the abdomen or abdominal region, with its appendages; the part of the body which succeeds the cephalothorax; the urosome. It is usually conspicuous, and may be longer than the rest of the animal. It is well marked in the macrurous or long-tailed crustaceans, as lobsters, prawns, shrimps, crawfish, etc., consisting of a series of flexible segments with appendages in the form of swimmerets, a rhipidura, a telson, etc. In the short-tailed or brachyurous crustaceans, as crabs, the tail is reduced and folded closely under the body, forming the apron. (*f*) In insects, the end of the abdomen, in any way distinguished; the pygidium; the claspers; the ovipositor, etc.: as, the bee carries a sting in its *tail*. (*g*) In many arachnidans, as scorpions, a well-marked abdominal or postabdominal region of the body, behind the thorax: its character is similar to that of the tail of a crustacean. (*h*) In worms, etc., the tail-end, or any part of the body away from the head. It is sometimes well marked, as in *Cephalobranchia*. Compare *tag-tail*, 1. (*i*) The buttocks. [Low.]

The middle part is called the *craze*, and the upper the *head*; each of these divisions is concentrated separately in a round buddle, and then finished off in the keeves. tail-feather (tāl′feŦʜ″ėr), *n.* One of the feathers of a bird's tail; specifically, the rectrices, or rudder-feathers, usually stiff pennaceous feathers, always devoid of a hyporachis, as distinguished from the tectrices or tail-coverts. Tail-feathers, like flight-feathers, have for the most part a wide inner and narrow outer vane, and when the tail is closed or folded they overlie one another alternately from side to side. The two middle feathers, whose webs are more nearly equal, and which overlie all the rest, are sometimes distinguished as *deck-feathers.* Tail-feathers are always paired, and hence of an even number. The number prevailing among birds is 12; this is characteristic, having few exceptions among all *Passeres*, whether oscine or clamatorial, and among many other birds, as birds of prey. In picarian birds 10 is the rule, though many have 12, and a few only 8; woodpeckers have 12, though apparently 10, one pair being rudimentary. In pigeons the rule is 12 or 14; sometimes there are 16 or 20. In gallinaceous birds the numbers run from 12 to 18 or 20. Waders have usually 12, often more, up to 20. Swimming-birds have sometimes only 12, usually higher numbers, as 16, 18, 20, 24, or even 32. The archæopteryx appears to have had 40. In a few birds the tail-feathers proper are extremely modified, as in the lyre-bird. (See *Menura, Trochilidæ.*) Tail-feathers which project far beyond the rest are said to be *long-exserted.* Shapes of individual rectrices are described as *truncate, incised, linear, acute, acuminate, filamentous, spatulate, mucronate*, etc. (See these words.) The relative lengths of rectrices go far to determine the shape of the tail as a whole, which is usually in the form of a fan. The termination of the tail is described as *even,*

truncate, acute, acuminate, cuneate, forked, forficate, furcate, emarginate, rounded, double-rounded, double-forked, etc. When the tail-feathers of opposite sides come together vertically, as in the rare but familiar case of the barn-yard fowl, the tail is said to be *complicate* or folded. The same tendency in the reversed direction results in the *scaphoid* or *boat-shaped* tail. A tail-feather spatulate at the end is called a *racket.* Some tail-feathers are coiled, *circinate* or *scorpioid;* others form a lyrate figure. A few birds, as grebes, have only rudimentary or no proper tail-feathers. The word is loosely extended to include tail-coverts in some cases. See cuts under *boat-shaped, Cincinnurus, lyre-bird, Sappho, Spathura,* and *Topaza.*

Tanning-liquor that has become "sour" or impure is called *tailings.* In metallurgy tailings are the part rejected in washing an ore that has passed through the screens of a stamp-mill, the worthless slimes left after the valuable portion has been separated by dressing or concentration. The part rejected as tailings may, however, at a future time be worked over and made to undergo still further concentration. The sand, gravel, and cobbles which pass through the sluices in hydraulic mining were formerly generally designated as *tailings;* of late years, and especially in State and United States legislative documents, they have been called "mining debris" or simply "debris."

tailor-bird (tā′lor-bėrd), *n.* One of various small passerine birds of the Oriental or Indian region, noted for the ingenuity with which they sew leaves together to form a nest. These birds are a sort of grass-warblers, grouped under the name *Cisticolæ.* They belong to such genera as *Suya, Suthora, Prinia* (with only ten tail-feathers, contrary to the rule in *Passeres*), and especially to *Sutoria* and *Orthotomus.* There are many species, some now placed in other genera. The original tailor-warbler of Latham (1783) was based upon a bird first described by Forster in 1781 as *Motacilla sutoria,* and given a French name by Sonnini in 1782, with reference to the two long middle tail-feathers. These descriptions furnished two nominal species, long known as *Sylvia sutoria* and *S. longicauda* respectively, till Horsford in 1820 founded a genus *Orthotomus* upon *O. sepium;* after which the original tailor-warbler was usually placed in *Orthotomus,* and received in the course of time several other specific designations. In 1851 Nicholson founded the genus *Sutoria* upon the original type species of Forster, Sonnini, and Latham; and in 1831 Lesson founded a nominal genus *Edela* upon a species of *Orthotomus.* The result of this by no means remarkable confusion in generic names is that the species of *Sutoria* proper have usually been called *Orthotomus.* (*a*) There are 3 species of *Sutoria,* or tailor-birds proper: *S. sutoria* or *S. longicauda* (mostly called *Orthotomus sutorius* or *O. longicauda*), throughout India and Ceylon, in parts of China, in Formosa, Hainan, etc.; *S. edela* of Java; and *S. maculicollis* of the Malay peninsula. (*b*) There are 10 or 12 species of *Orthotomus* proper, ranging from the Burmese countries and the Malay peninsula to Java, Sumatra, Borneo, and the Philippines. See also cuts under *Sutoria* and *Orthotomus.*

As the cue had been imposed (about 1644) upon the Chinese by the Manchus as an outward expression of loyalty to the Tatar dynasty, the Tai-pings discarded the cue, and hence were styled by the Chinese *Ch'ang-mao-tseh*, or 'long-haired rebels.' Hung-siu-tsuen also promulgated a kind of spurious Christianity, in which God (Shangti) was known as the "Heavenly Father," and Jesus Christ as the "Heavenly Elder Brother." ★ **talent**[1] (tal′ent), *n.* [< ME. *talent*, < OF. *talent*, a talent, also will, inclination, desire, F. *talent*, a talent, also ability, a man of ability, = Pr. *talen*, *talant*, *talan*, a talent, also will, inclination, desire, = Sp. Pg. It. *talento*, a talent, also will, inclination, desire, = D. G. Sw. Dan. *talent*, gift, endowment, = Ir. *talaint*, a talent, *tallan*, Gael. *talann*, a talent, faculty, < L. *talentum*, a Grecian weight, a talent of money, ML. also will, inclination, desire, < Gr. τάλαντον, a balance, a particular weight, esp. of gold, a sum of money, a talent (see def.), < √ ταλ, τλα, lift, bear, weigh, as in τλῆναι, bear, suffer, τλήμων, miserable, πολύτλας, much-suffering, Ἄτλας, Atlas (see *Atlas*[1]), L. *tollere*, lift, *tolerare*, bear (see *tolerate*), Skt. *tulā*, a balance, weight, *tulana*, lifting, √ *tul*, lift, weigh. The deflected uses of the word in ML. and Rom. are due in part to the fig. sense 'wealth,' and in part to the sense 'gift, endowment,' suggested by the parable of the talents (Mat. xxv.).] **1.** An ancient denomination of weight, originally Babylonian (though the name is Greek), and varying widely in value among different peoples and at different times. All the Assyrian weights had two values, the heavy being double the light, and there were also various types of each. The royal Babylonian commercial talent (or Assyrian talent) was divided into 60 minas, and each mina into 60 shekels. Its value (light weight) was in one type 29.63 kilograms (65 pounds 5 ounces avoirdupois), and in another 30.10 kilograms (66 pounds 5½ ounces). Derivatives of this talent which was equivalent to 3,000 shekels) were in use in Syria and Palestine and in Phenician colonies. Its money value is reckoned as approximately from $1,700 to $2,000. The Babylonian gold talent contained only 50 minas, and was thus five sixths of the commercial weight. The Babylonian silver talent was formed by multiplying the commercial talent by 13⅓ (the ratio of silver to an equivalent mass of gold), and afterward dividing by 10. The resulting light talent was sometimes again divided by 2. Derivatives of this talent were in use in Persia, Lydia, Macedonia, and Italy. It is the basis of much of the most ancient silver coinage. The Phenician silver talent, probably derived from the Babylonian, was in its lighter types about 43.4 kilograms (95 pounds 9 ounces avoirdupois), and, being halved, was adopted into the Ptolemaic system. The chief Greek talents were as follows: Old Æginetan, 40.3 kilograms (88 pounds 12 ounces); emporetic Attic (substantially later Æginetan), 36.4 kilograms (80 pounds 4 ounces); Solonic (= Egyptian), 25.8 kilograms (56 pounds 14 ounces). Talents mentioned by Homer and some other of the oldest writers appear to be small weights, perhaps shekels. The later Attic talent contained 60 minas, or 6,000 Attic drachmas, equal to 56 pounds 14 ounces. As a denomination of silver money it was equal to about $1,000. The great talent of the Romans is computed to be equal to £99 6*s.* 8*d.* sterling, or about $480, and the little talent to £75 sterling, or about $363.

According to Skeat, the ME. *talken* is derived from Sw. *tolka* = Dan. *tolke*, interpret, explain, = Icel. *tūlka*, interpret, plead one's case, ⟨ Sw. Dan. *tolk* = Icel. *tūlkr* = D. MHG. *tolk*, an interpreter (ME. *tolk, tulk*, a man), ⟨ Lith. *tulkas*, an interpreter (see *tolk*); but this notion is inconsistent with the form of the verb (no ME. form **tolken* appears in either sense 'talk' or 'interpret'), with phonetic laws (ME. **tolken* would not change to *talken*, and would not produce a mod. form *talk*, pron. tâk), and with the sense ('talk' and 'interpret' being by no means identical or adjacent notions). The fact that the formative *-k* is not common in ME. is not an argument against its admission in this case, inasmuch as it does actually occur in *stalk*[1], *smirk*[1], and other cases. Some confusion with a ME. **tolken*, which, though not found, is paralleled by a MD. *tolcken*, interpret, expound, may have occurred.] **I.** *intrans.* **1.** To make known or interchange thoughts by means of spoken words; converse: especially implying informal speech and colloquy, or the presence of a hearer.

=**Syn. 1** and **2.** *High, Tall, Lofty. High* is the most general of these words, and has some uses different from those of the others. When we say that a cloud is *high,* we may mean that it extends very far upward, or, more probably, that it is unusually far above the earth. *Tall* describes that which is slim in proportion to its height, as a mast, a pine or other tree, a steeple, a person, possibly a cliff: *tall* houses may be found in some parts of the world; a *tall* cloud would be of small width and great comparative height. *Tall* is also associated with height to which we are used or which we have come to regard as standard. A giant is *tall,* because so much *taller* than most men. *Lofty* denotes an imposing height: a room cannot well be *tall,* but may be *high,* or even *lofty:* as, the *lofty* arches of Westminster Hall. *High* and *lofty* may have application to moral or intellectual character; *tall* has not, except colloquially. *Tall* seems somewhat figurative when applied to that which does not live and grow.

A piece of wood on which notches or scores are cut to mark numbers, as in keeping an account or giving a receipt; loosely, anything on which a score or an account is kept. Before the use of writing, or before writing became general, this or something like it was the usual method of keeping accounts. In purchasing and selling it was customary to make duplicate tallies of the transaction, or to split one tally through the middle. In the English Exchequer tallies were used till 1812, which answered the purpose of receipts as well as simple records of matters of account. An Exchequer tally was an account of a sum of money lent to the government, or of a sum for which the government would be responsible. The tally itself consisted of a squared rod of hazel or other wood, having on one side notches indicating the sum for which the tally was an acknowledgment. On two other sides, opposite to each other, the amount of the sum, the name of the payer, and the date of the transaction were written by an officer called the writer of the tallies. This being done, the rod was then cleft longitudinally in such a manner that each piece retained one of the written sides, and one half of every notch cut in the tally. One of these parts, the *counterfoil* or *counterstock*, was kept in the Exchequer, and only the other, the *stock*, issued. When the part issued was returned to the Exchequer (usually in payment of taxes) the two parts were compared, as a check against fraudulent imitation. This was called *tally* or *tallies.* The size of the notches made on the tallies varied with the amount. The notch for £100 was the breadth of a thumb; for £1 the breadth of a barleycorn. A penny was indicated by a slight slit.

Alas! I cannot pay a jot; therefore
I'le kisse the *tally*, and confesse the score.
Herrick, To God.

Have you not seen a Baker's Maid
Between two equal Panniers sway'd?

On either side you hear 'em clatter.
Prior, Alma, ii.

3. A mark made to register a certain number of objects; one of a series of consecutive marks by which a number of objects are recorded or checked; also, a number as thus recorded; a number serving as a unit of computation. Thus, when packages of goods of uniform size and character are being delivered and an account of them taken, every fifth mark usually is called *tally*, and in counting aloud the word *tally* is used instead of five, after which the enumeration begins again; this is marked on a clerk's book, *tally* being the diagonal mark; though sometimes each mark is a *tally*, and the fifth or diagonal one is a *tally* of *tallies.*

It is officinally recognized as a refrigerant and laxative. Besides the pulp, the seeds, flowers, leaves, and bark all have their medicinal applications in India or elsewhere. The only species, *T. Indica*, is widely diffused through the tropics, indigenous in Africa, and naturalized from cultivation in Asia and America. It is a tree bearing abruptly pinnate leaves, with many pairs of small leaflets, and yellow and red flowers in terminal racemes. See *tamarind*.

Tamariscineæ (tam″a-ri-sin′ē-ē), *n. pl.* [NL. (A. N. Desvaux, 1815), < *Tamariscus* + *-ineæ*.] A family of dicotyledonous choripetalous plants, the tamarisk family, of the order *Hypericales*. It includes about 88 species, belonging to 4 genera classed in 2 tribes, for the types of which see *Tamarix* and *Reaumuria*. They are natives of temperate and warmer regions of the northern hemisphere and also of South Africa, occurring mostly in maritime salt-marshes or in sands and gravelly places among mountains. The seeds are either pilose, comose, or winged, which, together with the frequent willowy habit and narrow leaves, has suggested a superficial resemblance to the family *Salicaceæ*, the willow family. Many species have also been compared to the cypress. They are shrubs, rarely herbs or trees, their leaves commonly somewhat fleshy, and their flowers either small or showy, usually flesh-colored, pink, or white. Properly *Tamaricaceæ*.

A plant of the genus *Tamarix:* sometimes called *flowering cypress*. The common tamarisk is *T. Gallica*, a shrub or small tree of the Mediterranean region and Canaries. It is a prized ornamental shrub of feathery aspect, with scale-like leaves, and bearing clouds of pink flowers in late summer. It is a highly adaptable plant, thriving in wet, dry, or salty ground, rooting readily from slips and pushing forth vigorously; hence it is suitable for planting on shores and embankments. In the northern United States, however, it dies to the ground in severe winters. The stem and leaves contain much sulphate of soda. *T. mannifera* produces Jews' or tamarisk manna. (See *manna*.) *T. tetrandra*, *T. Indica*, *T. aphylla*, etc., yield the tamarisk-galls, which are said to contain 50 per cent. of tannin, and are used in dyeing and medicine. *T. aphylla* is found in northwest India and westward, and is sometimes distinguished as *tamarisk salt-tree*, from its secreting salt which incrusts its trunk in sufficient quantity for some culinary use. It is a bush or tree of coniferous aspect. *T. dioica* of India, etc., yields a pale-yellow soluble resin.

It is distinguished by its free or slightly united stamens, and ovary usually with three or four short styles. The most prominent creations of the style are numerous and large temples consisting of a square building with a pyramidal roof, and within a cella or adytum for the image of the god. Pillared halls are always associated with the temples, and the sacred inclosures always contain water-tanks or wells. Sculptured decoration, both exterior and interior, is exceedingly elaborate and exuberant. They have nine primaries, scutellate tarsi, and more or less conirostral bill, which usually exhibits a slight notch. They are confined to America, and almost entirely to the Neotropical region, only one genus (*Piranga*) having any extensive dispersion in North America. They are small birds, the largest scarcely exceeding a thrush in size, and the average length being about 5 inches. The *Tanagridæ* are closely related to the finches (*Fringillidæ*), and some of them have the bill as stout as that of a bullfinch; in other cases the bill is slender and acute, approaching that of the American warblers and guitguits (*Mniotiltidæ* and *Cœrebidæ*). In some instances the bill is strongly notched, and even toothed. The family has never been satisfactorily defined, and is probably insusceptible of exact technical delimitation. It includes several hundred species, of numerous genera. It is divided by Sclater into *Procniatinæ, Euphoniinæ, Tanagrinæ. Lamprotinæ, Phœnicophilinæ,* and *Pitylinæ*. See cuts under *Phœnicophilus. E. *tact, tactile, contact, contingent,* etc.] **I.** *a.* Touching; in *geom.*, touching at a single point: as, a *tangent* line; curves *tangent* to each other. —**Stationary tangent plane of a surface.** See *stationary.*—**Tangent plane,** a plane which touches a curved surface, as a sphere, cylinder, etc.

II. *n.* **1.** In *geom.*: (*a*) A straight line through two consecutive points (which see, under *consecutive*) of a curve or surface. If we take the line through any two points of the locus, and then, while one of these points remains fixed, consider the other as brought by a continuous and not infinitely protracted motion along the locus into coincidence with the former, the line in its final position will be a tangent at that point. The idea of time which appears in this definition is only so far essential that some parameter must be used in order to define a tangent at a singular point, and this parameter must be such as to present no discontinuity or point-singularity at that point. A tangent at an ordinary point of a curve or surface may be defined, without the use of any parameter, simply as a line through two points infinitely close together; although, if the doctrine of limits is used to explain away the idea of infinity, a parameter will be used for that purpose. A curve has only one tangent at an ordinary point, or a mere line-singularity, or a cusp, but

Tangent.—The equation of the curve is $y^2 = (x-x)^2x^3$. *a*, ordinary tangent; *b*, nodal tangent; *c*, cuspidal tangent; *d*, inflectional tangent.

has two or more tangents at a node. A surface has a single infinity of tangents lying in one plane at an ordinary point; and two of these (real or imaginary), called the *inflectional tangents,* pass through three or more consecutive points of the surface. On the nodal curve of a surface the tangents lie in two or more tangent planes; at a conical point they are generators of a quadric cone. The tangents of a curve in space form two sets which are all generators of one developable. There are points upon some curves and surfaces at which, according to the doctrine of limits, there are no tangents. Such is the point in the second figure where the two multiple tangents intersect; for, as a second point on the curve moves toward this, the line through the two points will oscillate faster and faster, without tending toward any limit. In the same sense, a curve may have no tangent at any point; it may be an undulating line with small undulations on the large ones, and still smaller on these, and so on *ad infinitum,* the lengths and amplitudes of the undulations being duly proportioned. It is antagonistic to the principle of duality which rules modern geometry to define the tangent of a plane curve as the line through two consecutive points on the curve. On the contrary, the definition of a plane curve is a locus described by the parametric motion of a line with a point upon it, the point slipping along the line and the line turning about the point; and such a generating line is a tangent. In like manner, a surface is the locus formed by a plane with a point upon it, the position of the point in the surface and the aspect of the surface about the point varying, the one and the other, according to the variations of the same pair of independent parameters. Such a plane is a tangent plane, and a tangent may equally be conceived as the line through two consecutive inflection-points, or as the line of intersection of two consecutive tangent planes. The tangent and tangent plane of a space curve are those of its definition as described by a line lying in a plane and having a point upon it, the plane turning continuously about the line, the point moving along the line, and the line turning in the plane around the point as a center. Euclid's definition of a tangent ("Elements," bk. iii., def. 2) as a line meeting a circle and not crossing it when produced does not extend to curves having inflections. The definition of the tangent as the limiting case of a secant, which is due to Descartes (but was perfected by Isaac Barrow, 1674), may well be considered as the foundation of modern mathematics. (*b*) The sect cut off upon the straight line touching a curve between the axis of abscissas and the point of tangency.—**2.** In *trigon.*, a function of an angle, being the ratio of one perpendicular side of a right triangle to the other, the angle opposite the first being the angle of which the tangent is considered as the function. Formerly the tangent was regarded as a line dependent upon an arc—namely, as the line tangent to the arc at one extremity, and intercepted by the produced radius which cuts off the arc at the other extremity.

Multiple Tangents.

3. In the clavichord, one of the thick pins of brass inserted in the back ends of the digitals so that the fingers should press them against the strings, and produce tones. Its action was not like that of the pianoforte-hammer, since it remained in contact with the string, and fixed the pitch of the tone by the place where it struck. If pressed too hard, it raised the pitch by increasing the string's tension. Accordingly the tone of the clavichord was necessarily weak.—**Artificial tangents.** See *artificial.*—**Chief tangent,** a tangent to a surface which is also a tangent of the intersection of the surface by the tangent plane at the same point of tangency.—**Conjugate, cotriple, double, imaginary, inflectional tangent.** See the adjectives.—**Ideal tangent,** a real line touching a real curve at two imaginary points.—**Inverse method of tangents,** the method of finding the curve belonging to a given tangent.—**Method of tangents.** (*a*) A method of obtaining the quadrature of a curve by means of an evaluation of the tangent to it, due to Roberval. In sighting, the scale is turned till one of its notches corresponding to the desired elevation or range is brought into intersection with the plane of the trajectory.—**Tangent screw,** a screw attached to or forming part of a clamp, and serving to move pieces clamped together relatively to one another with a slow motion.—**To fly** or **go off at a tangent,** to pass suddenly from one line of action or train of thought to another diverging widely from the first.

According to this custom the right of succession was not in the individual, but in the family to which he belonged — that is, succession was hereditary in the family, but elective in the individual. The primitive intention seems to have been that the inheritance should descend to the oldest or the most worthy of the blood and name of the deceased. This was in reality giving it to the strongest, and the practice often occasioned bloody wars in families.

I have already called it *Tanistry*, the system under which the grown men of the tribe elect their own chief, generally choosing a successor before the ruling chief dies, and almost invariably electing his brother or nearest mature male relative. *Maine*, Early Law and Custom, p. 145.

tannic (tan'ik), *a.* [< *tan*[1] + *-ic*.] Pertaining to or derived from tan.—**Tannic acid,** tannin, a white substance, having a most astringent taste, without bitterness. It is probably a glucoside. It is very soluble in water, much less so in alcohol. It has an acid reaction, and combines with most saliflable bases. It precipitates starch, albumin, and glutin, and forms with gelatin a very insoluble compound which is the basis of leather, and on which the art of tanning is founded. The word *tannin* has been loosely applied to all astringent vegetable principles. Commercially, tannic acid is of two kinds—*gallotannic acid*, derived from nutgalls, and *quercitannic acid*, which occurs in healthy leaves and bark. Gallotannic acid is the kind chiefly used. In medicine it is used internally as an astringent and externally as an astringent and styptic. Also called *tannin*.—**Tannic-acid ointment.** See *ointment*.

tanning (tan'ing), *n.* [Verbal n. of *tan*[1], *v.*] 1. The art or process of converting hides and skins into leather; the manufacture of leather. The process is chiefly chemical, and depends essentially upon the action of tannic acid, gallic acid, alum, sulphates of iron and copper, salt, and other agents on the gelatin, glutin, albumin, and other constituents of animal skins. Strictly, tanning is the treatment of hides with tannin, or tannic acid; the treatment of hides with alum and other minerals is called *tawing* (which see). In tanning proper, raw, salted, and dried hides of cattle are treated with some form of tannin, either by itself or in connection with other agents, and the product is called *leather* to distinguish it from the *white* or *alum leather, kid, lambskin*, etc., produced from the skins of goats, sheep, and other small animals. While a great number of plants yield tannin, the chief source of it is the bark of the oak, hemlock, birch, and beech, and the powdered leaves and young shoots of the sumac. Nutgalls are also used, as they carry gallic acid with the tannic acid. Many other vegetable matters are also used. The treatment of the hides in tanning is essentially a steeping or soaking in baths formed of extracts of tannin either by placing the ground bark directly in the baths, or by employing fluid extracts of the barks or sumacs. The hides are first freed from hair and fleshed, and are then placed in the baths. The art of tanning also includes the mechanical and chemical treatment of the hides to make them supple and water-proof. See *leather*, 1.

2. An appearance or hue of a brown color produced on the skin by the action of the sun.

tan-ooze (tan'öz), *n.* In *tanning*, an aqueous extract of tan-bark, as hemlock- or oak-bark or mixtures of these barks, or of other vegetable substances or mixtures of such substances with one another or with tan-bark, used in tanning. The ooze also usually contains in a suspended state the material or mixture of materials from which the water dissolves out the tannin in making the extract; and, after the more or less prolonged immersion therein of the hides or skins, the latter absorb a large proportion of the extracted tannin, and the ooze becomes somewhat shiny from animal matters. Also called *tan-liquor*.

As prepared by Berzelius, but not entirely pure, it appeared as a black powder, which assumed a grayish metallic luster under the burnisher, and which when gently heated took fire, and burned to an oxid. It was discovered by Ekeberg, in 1802, in the mineral afterward named by him *yttrotantalite*, and it has since been found in various rare minerals, as tantalite, columbite, pyrochlore, fergusonite, etc., in which it is almost always associated with niobium. ★**tapeworm** (tāp'wėrm), *n.* An entozoic parasitic worm, of flattened or tape-like form and indeterminate length, consisting of many separable joints, found in the adult state in the alimentary canal of most vertebrated animals. Such worms belong to the order *Cestoidea* or *Tæniada*, family *Tæniidæ*, and several different genera, especially *Tænia*, the true tapeworms, and *Bothriocephalus*, the broad tapes. The so-called "head" of a tapeworm, small and inconspicuous in comparison with the great length to which the body may attain, is the whole of the real worm, all the rest of the joints being merely successive generative buds, which contain the matured sexual elements, and are technically called *proglottides*. They are continually budded off from the head, the oldest joint being the one furthest from the head; and any number of them may be broken off and expelled from the body without stopping their continual gemmation. This is why no tapeworm can be eradicated unless the head is expelled from the host. The chain of links or joints is the strobila; it may consist of several hundred generative buds, and grow to be several yards long. These formidable parasites are parenchymatous, having no mouth nor alimentary canal, and live by absorbing nourishment from that intended to nourish the host, so that persons thus parasitized may suffer from defective nutrition while acquiring a ravenous appetite. The head of the tape is provided with hooks or suckers, or both, for adhering to the mucous membrane of the host. The ova, matured in every one of the joints, do not complete their development in the animal in which the adult exists. They require to be swallowed by some other vertebrate, the ripe proglottides being expelled from the bowel of the host with all their contained ova fertilized. The segments or proglottides decompose and liberate the ova, which are covered with a capsule. After being swallowed the capsule bursts, and an embryo, called a *proscolex*, is liberated. This embryo, by means of spines, perforates the tissues of some contiguous organ, or of a blood-vessel, in the latter case being carried by the blood to some solid part of the body, as the liver or brain, where it surrounds itself with a cyst, and develops a vesicle containing a fluid. It is now called a *scolex* or *hydatid*, and was formerly known as the *cystic worm*. The scolex is incapable of further development till swallowed and received a second time into the alimentary canal of a vertebrate. Here it becomes the head of the true tapeworm (see *tænia-head*), from which proglottides are developed posteriorly by gemmation, and the adult animal with which the cycle began is thus reached. (See cut under *tænia*.) At least eight tapeworms, mostly of the genus *Tænia*, are found in man. The pork tape is *T. solium*, which in its cystic form (the so-called *Cysticercus cellulosæ*) in the pig produces the disease measles (see *measles*, 2); it is acquired by those who eat measly pork, or raw sausages made with such pork. The beef-tape is *T. mediocanellata*. The Egyptian or dwarf tape is *T. nana;* others are the elliptic-jointed, *T. elliptica;* the crested, *T. lophosoma;* the spotted, *T. flavopuncta*. A dog-tape is *T. serrata;* its larva, called *Cysticercus pisiformis*, is the pea-measle of the rabbit. Another dog-tape is *T. cœnurus*, whose larva is the cystic worm (*Cœnurus cerebralis*) of the sheep's brain, producing the gid or staggers. A third dog-tape is *T. echinococcus*, whose larva, known as *Echinococcus veterinorum*, is a common hydatid sometimes found in man. *T. marginata* of the dog is the tapeworm from the slender hydatid *Cysticercus tenuicollis* of the sheep. A cysticercus of the mouse becomes *Tænia crassicollis* in the cat. Certain cysticerci of moles become in the fox *Tænia tenuicollis* and *T. crassiceps*. The broad tapeworm of man is *Bothriocephalus latus*, also called *Swiss tapeworm*, and another human parasite of this genus is *B. cordatus*. Tapes are also called *ribbon-worms*. See cut under *Cestoidea*, also *cœnurus*, *cysticercus*, *echinococcus*, *hydatis*, *proglottis*, *scolex*, *deutoscolex*, *strobila*.

(*b*) In the puddling-furnace, a small hole through which the slag, technically termed *tap-cinder*, is let out, and which during the process of puddling is stopped with sand. See diagram under *puddling-furnace*. (*c*) In a cementation-furnace, a small hole in one end of each pot, opposite to which is a hole in the furnace-wall, used for the insertion of "trial" or "tap" bars, so placed as to be accessible for ready withdrawal and inspection during the cementation process. The body is stout and clumsy, with thick legs, ending in four small hoofs on the fore feet and three on the hind. The head is peculiarly shaped, with a long and very flexible snout or a short proboscis, and a high crest or poll. The body is scantily clothed or nearly naked; the hide is used for leather, and the flesh for food. The common American tapir, to which the name specially

American Tapir (*Tapirus americanus*).

applies, is *Tapirus americanus*, about 4 feet long, entirely of a blackish color when adult. Other species of America are *Tapirus roulini* and *Elasmognathus bairdi* and *E. dowi* of Central America. The Malay tapir, *Tapirus* (or

The species are very few, though widely dispersed in both hemispheres. The genera are only 3—*Tapirus*, the scarcely different *Rhinochœrus*, and the well-marked *Elasmognathus*, peculiar in the ossified nasal septum and some other cranial characters. The first and last of these are American, and the other is Malayan. See also cuts under *tapir* and *Perissodactyla*.

A conical cavity is dug in the side of a bank or a steep hill, and a cast-iron pan is placed at the bottom, from which leads a spout into a barrel for collecting the tar. Billets of wood (such as pine or fir) are thrown into this cavity, and, being covered with turf, are slowly burned without flame. The wood chiefly used in Europe is that of the Scotch pine, *Pinus sylvestris*, and the Siberian larch, *Larix Sibirica*; in the United States, that of the long-leaved pine, *Pinus palustris.* Most of the tar produced in the United States is made in North Carolina, Virginia, and Georgia. In England wood-tar is chiefly obtained as a by-product in the destructive distillation of wood for the manufacture of wood-vinegar (pyroligneous acid) and wood-spirit (methyl alcohol). It has an acid reaction, and contains various liquid matters, of which the principal are methyl-acetate, acetone, hydrocarbons of the benzene series, and a number of oxidized compounds, as carbolic acid. Eupion, capnomor, paraffin, chrysene, etc., are found among its solid products. It possesses valuable antiseptic properties, owing to the creosote it contains, and is used extensively for coating and preserving timber and iron in exposed situations, and for impregnating ships' ropes and cordage. Coal-tar is extensively obtained in the process of gas-manufacture. It is a very valuable substance, the compounds obtained from it forming the basis of many chemical manufactures. See *coal-tar.*

Sometimes an inner white circle replaces the blue. A hit is valued in scoring according to its nearness to the center, usually 9, 7, 5, 3, 1 for each of the 5 circles respectively. The target for practice with the musket or rifle was formerly flat, and made of planks in one or more thicknesses. Modern targets for long-range practice with the rifle are made of a wooden frame covered with canvas over which is pasted stout paper properly marked. Some targets for short range or gallery practice are of metal properly painted. S. hist.,* a tariff established by an act passed in 1846, in accordance with principles laid down by Robert J. Walker, Secretary of the Treasury. It classified all articles under eight schedules, and greatly reduced the duties from the tariff of 1842. Its rates were still further reduced by the act of 1857.—**Wilson tariff** (from William L. Wilson, chairman of the Ways and Means Committee), the tariff established by the act of 1894. It made the average rate of duties somewhat lower than that which resulted from the McKinley tariff. It is a stemless plant with the general habit of the caladiums of house and garden culture. The leaves are heart-shaped and about a foot long. Its chief value lies in its stem-like tuberous starchy root, which is eaten boiled or baked, made into a bread or pudding, or in the Sandwich Islands, where it is the staple food of the natives, in the form of poi (which see). The tubers, when baked, pounded, and pressed, keep fresh many months. An excellent starch can be had from them. The leaves and leaf-stalks are also edible, with the character of spinach or asparagus. All parts of the plant are acrid, but this quality is removed by cooking. Taro is propagated by a cutting from the top of the tuber. The acridity is due to the presence of raphides or needle-crystals of oxalate of lime, which are destroyed by thorough cooking.

During the cold season their hair is long and soft, lying so close as to feel like a bear's fur, and then it is grizzled; in summer it falls much away, leaving only a quantity on the back and loins. These sections, as proposed by Olivier, were (1) *Pentamera*, having five joints to all the tarsi; (2) *Heteromera*, having the four anterior tarsi five-jointed and the two posterior four-jointed; (3) *Tetramera*, having four joints to all the tarsi; (4) *Trimera*, having three joints to all the tarsi. To these Latreille added (5) *Dimera*, having two joints to all the tarsi, and (6) *Monomera*, having but a single tarsal joint in each foot. Some of these divisions are now known to have rested on imperfect observations, and all are subject to exceptions among closely allied species; hence the tarsal system has been generally abandoned or modified, though in many respects it approached a natural classification, and, admitting the exceptions, the divisions can still be used with advantage. Its convenience is such that attempts have also been made to retain it, in its general features, with substitution of other names intended to correct the early imperfect observations, as *Cryptopentamera*, *Pseudotetramera*, *Subpentamera*, etc.; and the adjectives derived from all these terms, as *pentamerous*, *heteromerous*, etc., are regularly used in describing beetles and their tarsi.

tarsier (tär'si-ėr), *n.* [< F. *tarsier*, < NL. *Tarsius:* see *Tarsius.*] The malmag, an animal of the genus *Tarsius:* so called from the singular structure of the foot. Two of the proximal tarsals, the calcaneum and the scaphoid, are lengthened into slender rods simulating metatarsals, and bearing the true heel far above an apparent heel at the bases of the toes. The tarsus is thus about as long as all the rest of the foot, and much longer than the metatarsus. The condition of the parts is unique among mammals, though approached in some of the galagos (of the genus *Otolicnus*). The tarsier is a small nocturnal lemur of slender form, with long hind legs, very long slender tail tufted at the end, fingers and toes padded at the ends like a tree-frog's, and very large eyes. It is arboreal and insectivorous, and inhabits Borneo, Celebes, Sumatra, and some other islands. It is not distantly related to the aye-aye. See cut under *Tarsius.*

They have teeth of three kinds; permanent canines; four small simple incisors; pectoral mammæ besides two inguinal ones; the fibula partially ankylosed with the tibia; the second and third digits of the foot armed with subulate claws, the rest with flattened nails; a peculiar tarsus (see *tarsier*); and the orbits of the eyes partially closed behind by the union of the alisphenoid and malar bones. rami are straight and slender without coronoid process or the inflected angle very characteristic of marsupials; and the tail is very long, slender, and prehensile. The only species, *T. rostratus*, is of the size and somewhat the appearance of a mouse, and inhabits western Australia, living in trees and bushes, and feeding on insects and wild honey.

tarsometatarsal (tär-sō-met-ą-tär'sal), *a.* and *n.* [< *tarsus* + *metatarsus* (cf. *tarsometatarsus*) + *-al.*] **I.** *a.* **1.** Pertaining to the tarsus and the metatarsus.—**2.** Resulting from combination of tarsal and metatarsal bones, as a single compound bone; having parts of the tarsus combined with itself, as a metatarsus; of or pertaining to the tarsometatarsus. See cuts under *metatarsus* and *tarsometatarsus.*

tarsometatarsus (tär-sō-met-ą-tär'sus), *n.*; pl. *tarsometatarsi* (-sī). [NL., < *tarsus* + *metatarsus.*] The single compound bone of some animals, especially birds, resulting from the combination of tarsal and metatarsal bones in one. This formation occurs in all birds and probably some reptiles. In the former the three principal metatarsal bones fuse into one, the fourth metatarsal remaining distinct or only incompletely joined to the rest; and to the proximal extremity of the compound metatarsal thus formed are also ankylosed the elements of the distal tarsal series. The result is similar to that seen in the compound cannon-bone of hoofed quadrupeds, though this has no tarsal elements. The tarsometatarsus is a comparatively large stout bone, extending from the heel or suffrago to the bases of the toes. It corresponds to that part of the foot commonly called the *tarsus* in descriptive ornithology, and is usually naked and scaly, though sometimes feathered. Its proximal extremity usually presents a large bony protuberance (the so-called calcaneum or hypotarsus), perforated for the tendons of certain muscles, and the distal extremity is divided into three prongs (two in the ostrich), each bearing an articular surface for one of three toes (the first toe, or hallux, when present, being differently attached to the foot by an accessory metatarsal). The bone is nearly always compressed, or of less width than depth; but in the penguins it is broad from side to side and shows two fontanelles, or vacant spaces, indicating its triple composition. It is often called simply *metatarsus*, its tarsal elements being ignored. See also cut under *metatarsus.*

tarsotarsal (tär-sō-tär'sal), *a.* [< *tarsus* + *tarsus* + *-al.*] Mediotarsal, as the ankle-joint of birds and reptiles, which is situated between the two rows of tarsal bones, and not between the tibia and the tarsus as in mammals.

tarsotibial (tär-sō-tib'i-al), *a.* [< *tarsus* + *tibia* + *-al.*] Same as *tibiotarsal.*

tarsotomy (tär-sot'ō-mi), *n.* [< NL. *tarsus*, a cartilage of the eyelids, + Gr. τομία, a cutting, < τέμνειν, ταμεῖν, cut.] In *surg.*, the section or removal of the tarsal cartilages. *Dunglison.*

tarsus (tär'sus), *n.*; pl. *tarsi* (-sī). [= F. *tarse*, < NL. *tarsus*, < Gr. ταρσός, any broad flat surface, as for warming or drying things upon (ταρσὸς ποδός, the flat of the foot), < τέρσεσθαι, dry, dry up: see *terra*, *thirst.*] **1.** In *zoöl.* and *anat.*, the proximal segment of the pes or foot, corresponding to the carpus of the manus or hand; the collection of bones between the tibia and the metatarsus, entering into the construction of the ankle-joint, and into that part of the foot known in man as the instep. It consists in man of seven bones: the astragalus or hucklebone, alone supporting the leg; the calcaneum, os calcis, or heel-bone; the scaphoid or navicular bone; the cuboid, supporting the two outer metatarsals; and three cuneiform bones, supporting the other three metatarsals. The tarsal bones tend to arrange themselves in two rows, called the *proximal* and *distal* rows: in man the first three just named belong to the proximal row. A generalized tarsus, as found in some reptiles, consists of nine tarsal bones: an outer proximal, the fibulare; an inner proximal, the tibiale; one between these, the intermedium; a central one, the centrale; with five in a distal row, one for each metatarsal, called *tarsalia*, and distinguished as tarsale I–V from inner to outer side. Various suppressions, confluences with one another or with other bones, or additions to the number occur, destroying the symmetry of the typical tarsus; but seven is the normal mammalian number, as in man, where the astragalus is supposed to = the tibiale + intermedium; the calcaneum = fibulare; the scaphoid = centrale; the cuboid = tarsalia IV + V; the three cuneiforms = tarsalia I, II, III. In all *Mammalia* the ankle-joint is between the tarsus and the tibia, or tibiotarsal; in all vertebrates below *Mammalia* which have a tarsus the ankle-joint is among the tarsal bones, between the proximal and distal rows, and therefore mediotarsal. Birds offer the most exceptional case, there being apparently no tarsus, or tarsal bones, in the adult. This appa-

rent anomaly is explained by the fact that the embryo has several tarsal elements, proximal ones of which become consolidated with the tibia as the condyles of the latter, and distal ones of which become similarly fused with the principal metatarsal bone. Hence, a bird's tibia is really a tibiotarsus, and a bird's principal metatarsal bone is really a tarsometatarsus; and the ankle-joint, apparently between the tibia and the metatarsus, is really mediotarsal, as is usual below mammals. See cuts under *booted*, *Catarrhina*, *digitigrade*, *Equidæ*, *foot*, *metatarsus*, *Plantigrada*, and *Plesiosaurus*.

Hence—**2.** In *descriptive ornith.*, the shank; the part of the leg (properly of the foot) of a bird which extends from the bases of the toes to the first joint above, the principal bone of this section consisting of three metatarsal bones fused together and with distal tarsal bones. See cuts under *booted*, *scutellate*, and *tarsometatarsus*.—**3.** In *entom.*: (*a*) The foot; the terminal segment of any leg, next to and beyond the tibia, consisting of a variable number of joints, usually five, and ending sometimes in a pair of claws like pincers, or in a sucker-like pad, or otherwise. It normally consists of five joints, but some of these may be very small or entirely aborted, and in a few insects there is only one joint. These modifications are much used in classification, especially of beetles. (See *tarsal system*, under *tarsal*.) The joints are distinguished by numbers, the first being that attached to the tibia (in bees sometimes called the *planta* or *palma*, and in flies the *metatarsus*). The last joint is generally terminated by two hooks or claws called *ungues*, with a little piece, the onychium, between them, which Huxley regards as a sixth joint. (See *unguis*.) The tarsi serve the same purposes as the feet of vertebrated animals. See cuts under *coxa*, *Erotylus*, *mole-cricket*, *Pentamera*, and *Tetramera*. The reason given by Paracelsus, "because it produces oil, water, tincture, and salt, which burn the patient as *Tartarus* does," is evidently imagined; but the word was no doubt connected with L. *Tartarus* in some vague way. It is said to be of Ar. origin, but it could not come, except by very unusual corruption, from the Ar. word given as its source, viz. Ar. This acid has four modifications, all having the same chemical composition, but characterized chiefly by their differences of action upon a ray of polarized light—common or dextrorotatory, levorotatory, racemic or paratartaric, and optically inactive or mesotartaric acid. The first-named is the commercial article. It crystallizes in large rhombic prisms, transparent and colorless, and very soluble in water. It is inodorous, and very sour to the taste. Tartaric acid is dibasic; its salts are called *tartrates*, and have a most remarkable disposition to form double salts, such as Rochelle salts, double potassium sodium tartrate, tartar emetic, double potassium antimonyl tartrate, etc. Tartaric acid is found in the free state in grape-juice, tamarinds, and many fruits, but chiefly in the form of acid potassium tartrate. It is obtained commercially from this salt, called *argol*, which deposits in crusts from fermenting wines. The purified salt is called *cream of tartar*. Tartaric acid is largely used in dyeing and calico-printing, and also in medicine.

Skeat also quotes a passage from Udall, tr. of "Erasmus's Apophthegms," Diogenes, § 68, "Geuyng vnto the same *taunt pour taunte*, or one for another," suggesting an origin in the F. phrase *tant pour tant*, 'so much for so much': see *tantity*. There is no evidence that the sense was affected by OF. *tanser*, *tancer*, *tenser*, F. *tancer*, check, scold, reprove, taunt, < ML. as if **tentiare*, from the same source as *tentare*.] **1.** Originally, to tease; rally; later, to tease spitefully; reproach or upbraid with severe or insulting words, or by casting something in one's teeth; twit scornfully or insultingly.

=Syn. 1. *Ridicule*, *Chaff*, *Deride*, *Mock*, *Upbraid*, *Taunt*, *Flout*, *Twit*. We may *ridicule* or *chaff* from mere sportiveness; we may *ridicule* or *upbraid* with a reformatory purpose; the other words represent, and all may represent, an act that is unkind. All except *mock* imply the use of words. As to *ridicule*, see *ludicrous*, and *banter*, *v.* and *n.* *Chaff*, which is still somewhat colloquial, means to make fun of or tease, kindly or unkindly, by light, ironical, or satirical remarks or questions. *Deride* expresses a hard and contemptuous feeling: "*derision* is ill-humored and scornful; it is anger wearing the mask of *ridicule*" (*C. J. Smith*, Syn. Disc., p. 667). It is not always so severe as this quotation makes it. *Mock* in its strongest sense expresses the next degree beyond *derision*, but with less pretense of mirth (see *imitate*). We *upbraid* a person in the hope of making him feel his guilt and mend his ways, or for the relief that our feelings find in expression; the word is one degree weaker than *taunt*. To *taunt* is to press upon a person certain facts or accusations of a reproachful character unsparingly, for the purpose of annoying or shaming, and glorying in the effect of the insulting words: as, to *taunt* one with his failure. To *flout*, or *flout at*, is to *mock* or insult with energy or abruptness; *flout* is the strongest of these words. To *twit* is to *taunt* over small matters, or in a small way; *twit* bears the relation of a diminutive to *taunt*.

taunt[1] (tänt or tânt), *n.* [Also dial. *tant;* < *taunt*[1], *v.*] **1.** Upbraiding words; bitter or sarcastic reproach; insulting invective.

Have I lived to stand at the *taunt* of one that makes fritters of English? *Shak.*, M. W. of W., v. 5. 151.

In a more general sense the word includes assessments on specific properties benefited by a local improvement, for the purpose of paying expenses of that improvement. Taxes, in the stricter sense, are *direct* when demanded from the very persons who it is supposed as a general thing will bear their burden: as, for example, poll-taxes, land or property taxes, income taxes, taxes for keeping man-servants, carriages, or dogs. Taxes are said to be *indirect* when they are demanded from persons who it is supposed as a general thing will indemnify themselves at the expense of others—that is, when they are levied on commodities before they reach the consumer, and are paid by those upon whom they ultimately fall, not as taxes, but as part of the market price of the commodity (*Cooley*): as, for example, the taxes called *customs,* which are imposed on certain classes of imported goods, and those called *excise duties,* which are imposed on certain home manufactures and articles of inland production. In the United States most state and municipal taxes are direct, and levied upon the assessed values of real and personal property, while the revenue required for general governmental purposes is derived from indirect taxes upon certain imports, and upon whisky, tobacco, etc. In the United Kingdom the governmental revenues are derived from both direct and indirect sources—from taxes on income, stamps, dogs, etc., from imposts on a few imported articles of consumption, especially tea, spirits, tobacco, and wines, and from excise duties. House taxes, or taxes on rental, form the largest part of the local rev-

enues, municipal revenues being entirely raised from this source. See phrases below.

> Since (bountious Prince) on me and my Descent
> Thou doost impose no other *tax* nor Rent
> But one sole Precept, of most just condition
> (No Precept neither, but a Prohibition).
> *Sylvester*, tr. of Du Bartas's Weeks, ii., Eden.

According to the theory advocated by Henry George and others, this tax should supersede all others, and should fall only on valuable land, exclusive of improvements.

The *single tax*, in short, would call upon men to contribute to the public revenues not in proportion to what they produce or accumulate, but in proportion to the value of the natural opportunities they hold. It would compel them to pay just as much for holding land idle as for putting it to its fullest use. *Henry George*, Single Tax Platform.

Each of these words had its older, peculiar, or figurative uses. See definitions of the words, and also of *subsidy.*

Taxites (tak-sī'tēz), *n.* [NL., < *Taxus* + *-ites*.] In *geol.*, a generic name given by Brongniart to fossil leaves and stems resembling, and supposed to be closely related to, the living genus *Taxus*. Various fragments of fossil plants have been described as *Taxites*, chiefly from the Tertiary: some of these are now referred to *Sequoia*, and in regard to all or most of them there is considerable uncertainty.

taxless (taks'les), *a.* [< *tax* + *-less*.] Free from taxes; untaxed.

taxman (taks'man), *n.* A collector of taxes. *The Atlantic*, LXVII. 434. [Rare.]

Taxodieæ (tak-sō-dī'ē-ē), *n. pl.* [NL. (Parlatore, 1864), < *Taxodium* + *-eæ*.] A tribe of coniferous plants of the family *Pinaceæ*, based on the genus *Taxodium*. Besides the type it includes the 6 following important genera: *Sequoia*, *Sciadopitys*, *Belis*, *Athrotaxis*, *Cryptomeria*, and *Glyptostrobus*. The genera are all small, three of them monotypic, two with only 2 species each, and the remaining one with only 3 species.

Taxodiinæ (tak-sō-di-ī'nē), *n. pl.* [NL. (A. W. Eichler, 1887), < *Taxodium* + *-inæ*.] A subtribe of conifers, classed under the tribe *Abieteæ*, and including 12 species, belonging to 7 genera, differing widely both in characters and in locality, some of them among the most remarkable of all known trees. Several inhabit Japan or China or both, as *Glyptostrobus*, including two small species, and *Sciadopitys*, *Belis*, and *Cryptomeria*, all monotypic genera of lofty trees. A second group, of three species of small or middle-sized trees, the genus *Athrotaxis*, occurs in Tasmania and Victoria. The remaining or North American group consists of the two genera *Taxodium* and *Sequoia*, each of two species, all attaining either an immense height or girth or both. It is identical with the tribe *Taxodieæ* (which see) as delimited by Engler in his Syllabus of the same work in which Eichler outlined the subtribe.

Taxodium (tak-sō'di-um), *n.* [NL. (L. C. Richard, 1810), < Gr. *τάξος*, yew, + *εἶδος*, form.] A genus of coniferous trees, of the family *Pinaceæ*, type of the tribe *Taxodieæ*. It is characterized by a globose or obovoid cone composed of scales with an entire margin, at the apex woody, dilated, and truncate, on the back umbonate or mucronate, and including the two irregularly three-angled seeds, which contain six to nine cotyledons. There are two species, natives of the United States and Mexico. They are loosely branched trees, bearing alternate, somewhat spirally set leaves, linear and spreading in two ranks, or small, appressed, and scale-like on the flowering branches. The slender leaf-bearing branches resemble pinnate leaves, and fall off in autumn like the leaves of the larch. The flowers are monœcious, both sexes on the same branches, the staminate forming drooping spiked panicles, while the female form sessile globose aments scattered singly or in pairs, and closely crowded with spirally set scales. The fruit is a hard round cone, an inch long, with its very thick angular peltate stalked scales gaping apart at maturity, but persistent after the fall of the seeds, which are large, shining, and coriaceous or corky on the surface. *T. distichum*, the bald or red cypress of the United States, is characteristic of southern swamps near the sea-coast, occupying large tracts to the exclusion of other trees, and extending often into deep water around lake-margins. It occurs from Delaware to Texas, and also in the Mississippi and Ohio valleys to Indiana and Illinois. It often reaches a great size, sometimes 150 feet in height and 36 in girth, and furnishes a valuable wood which is soft, close, easily worked or split, and very durable, and is much employed for cooperage, railway-ties, fences, posts, and shingles. It is almost indestructible in water or in contact with earth, but is often injured, especially beyond the Mississippi, by a fungus, a species of *Dædalea*. Two varieties are distinguished by lumbermen—the *white cypress*, with light-brown wood, and the *black cypress*, with dark-brown harder and more durable wood, at first heavier than water; the sap-wood of both is nearly white. The tree is also the source of an essential oil, a superior turpentine, and a medicinal resin, and from the beauty of its feathery foliage it is valued for lawn cultivation. It is especially remarkable for its habit, when growing under water, of throwing up large smooth conical projections known as *cypress-knees*, commonly 2 (sometimes 7) feet high, covered with reddish bark like the roots, and hollow, as is the base of the tree itself. Their utility to the tree was long uncertain, although various explanations were advanced, as, for example, that they were arrested tree trunks, but recent investigations show that they act as aërating organs. (Compare *cypress-knee*, *knee*, 3 (*d*), and *cypress*[1].) The tree itself often rises out of water as a straight gray shaft 80 or 90 feet high before dividing into its flat spreading top, its base ribbed by large projecting buttresses, each continuous below with a strong and branching root, from horizontal branches of which the knees arise. The tree is also remarkable for its great longevity, growing rapidly at first, in cultivation sometimes adding an inch in diameter a year, but soon becoming as slow-growing as the yew, and adding only an inch in twelve to thirty years. The other species, *T. Mexicanum*, the Mexican cypress, or ahuehete, forms extensive forests in the Sierra Madre, at elevations from 4,000 to 9,000 feet, itself often reaching 70 to 100 feet high, with longer and pendulous branchlets and more persistent greener leaves. It attains an even greater size and age than *T. distichum;* the celebrated *cypress of Montezuma*, in the gardens of Chapultepec, variously estimated from 700 to 2,000 years old, is 41 to 45 feet in girth and about 120 feet high; one at Atlixco is about 76 feet, and another, near Oaxaca, 112 feet in girth; the latter was estimated by A. de Candolle and Asa Gray to be at least 4,000 years old. A third species, *T. heterophyllum* of Brongniart (for which see *water-pine*, under *pine*[1]), is now separated as *Glyptostrobus heterophyllus*, on account of its obovoid cone and stalked seeds. The genus is of great antiquity geologically, being found in the Cretaceous and in great abundance in the Tertiary of nearly all parts of the world.

Taxodium distichum.

Taxoideæ (tak-soi'dē-ē), *n. pl.* [NL. (A. W. Eichler, 1887), < *Taxus* + Gr. *εἶδος*, form, + *-eæ*.] A subfamily of conifers, equivalent to the family *Taxaceæ* (which see). It included nine genera arranged under two tribes, but at that date the genus *Ginkgo* was regarded as a conifer and classed in this group. Since the discovery in 1896 by Hirase of motile spermatozoids in the male flowers of that genus it has been removed from this group and made the type of a distinct family and order. See *Ginkgo*. Among the genera that are still retained may be mentioned *Saxegothæa*, a small yew-like tree of Patagonia, and *Microcachrys*, a prostrate shrub of Tasmania. For the other principal genera, see *Taxaceæ*.

taxology (tak-sol'ō-ji), *n.* [Prop. **taxiology;* < Gr. *τάξις*, order, arrangement, < *τάσσειν*, arrange, + *-λογία*, < *λέγειν*, speak: see *-ology*.] The science of arrangement or classification; what is known of taxonomy.

Invert., p. 561.

Our knowledge of the anatomy, and especially of the development, of the Invertebrata is increasing with such prodigious rapidity that the views of *Taxonomists* in regard to the proper manner of expressing that knowledge by classification are undergoing, and for some time to come are likely to undergo, incessant modifications. *Huxley*, Anat. Invert., p. 561.

taxonomy (tak-son'ō-mi), *n.* [Prop. **taxionomy;* < F. *taxonomie*, *taxinomie*, and prop. *taxionomie*, < Gr. *τάξις*, orderly arrangement, + *νέμειν*, distribute, dispense, arrange, > *νόμος*, a law.] The laws and principles of taxology, or their application to the classifying of objects of natural history; that department of science which treats of classification; the practice of classifying according to certain principles.

Taxus (tak'sus), *n.* [NL. (Tournefort, 1700), < L. *taxus* = Gr. *τάξος*, a yew-tree.] A genus of conifers, the yews, type of the tribe *Taxeæ* and family *Taxaceæ*. It is characterized by mostly dicœcious flowers, the female solitary and consisting of a single erect ovule on a small annular disk, which soon becomes cup-shaped and fleshy, and finally forms a pulpy berry inclosing the seed, but free from it and open at the truncate apex. The small globular male flowers are solitary in the axils, surrounded by a few imbricated scales, with a short stalked stamen-column, five to eight roundish depressed and furrowed anthers, which become almost umbrella-shaped and four- to six-lobed after maturity, and bear three to eight cells connate into a ring. The ripened seed is hard, woody, and nut-like, somewhat viscous when fresh, and contains an embryo of two cotyledons. There are 6 or 8 species, by some considered all varieties of one, natives all of the northern hemisphere and widely dispersed. They are evergreen trees or shrubs, bearing short-petioled flat linear rigid leaves which are somewhat spirally inserted, but usually spread falcately into ranks. The genus is remarkable for the great variation within the same species, *T. baccata*, the yew, seldom exceeding 15 or 20 feet in height in England, but in the Himalayas becoming a naked trunk 30 feet high and often 16 in girth, its top reaching 70 or, it is said, sometimes 100 feet in height. *T. brevifolia* is similarly a low shrub in Montana, but a stately tree sometimes 75 feet high near the Pacific. *T. Canadensis*, the ground-hemlock, formerly regarded as a variety of the British species, usually a prostrate shrub, extends from New Jersey and Iowa northward, generally under evergreens. The other North American species, *T. Floridana* of West Florida and *T. globosa* of Mexico, are small trees, as are those of Japan, where *T. cuspidata* is cultivated and many curious varieties have been produced. The genus is similar to *Taxodium* in its slow growth, and remarkable for the great bulk attained by older trees, as the celebrated Ankernyke yew near Staines, in England, within sight of which the Magna Charta was signed, which is 27½ feet in girth; the Tisbury yew in Wilts, 37 feet; and the Fortingall yew in Perthshire, 56½; the first of these was estimated by Asa Gray to be at least 1,100 years old, and the second 1,000. See *yew*, and compare *hemlock-spruce*.

Taylorism (tā'lọr-izm), *n.* [< *Taylor* (see def.) + *-ism*.] A phase of New England Calvinism, deriving its name from Dr. N. W. Taylor of New Haven, Connecticut (1786–1858). It was a modification of the earlier New England Calvinism, in that it insisted upon a real freedom of the will, a natural ability of moral choice, and a distinction between depravity as a tendency to sin and sin itself, the latter consisting wholly in a voluntary choice of evil. It was sharply opposed to Tylerism.

Puritan theology had developed in New England into Edwardism, and then into Hopkinsianism, Emmonsism, and *Taylorism*. *Encyc. Brit.*, XIX. 700.

G. *thee* = Sw. Dan. *te* = NGr. *τέϊ* (NL. *thea*), prob., through Malay *te, teh*, < Chinese (Fuhkien dial.) *te* (pron. tā); (*b*) *cha, tcha, chaa, chia, cia* = Pg. *cha* = Sp. (esp. Amer. A product consisting of the prepared leaves of the tea-plant (see def. 2), of various kinds and qualities depending chiefly on the method of treatment. Black tea is manufactured by a process of withering under the influence of light, heat, and air, rolling, fermenting, sunning, and firing (heating with charcoal in a sieve); green tea by a more rapid process without the withering and fermenting, and with more firing. Among the chief black teas are *bohea, congou, souchong, caper-tea, oolong*, and *pekoe;* among the green, *twankay, hyson skin, young hyson, hyson, imperial*, and *gunpowder*. The gunpowder is the finest green, the pekoe the finest black, both being made from the first pickings—*flowery pekoe* from leaves so young as to be still covered with down. A third group of teas is known as the *scented*, generally of poorer quality, flavored with the flowers of the fragrant olive (see *Osmanthus*), of the chulan, and sometimes of the Cape jasmine (see *Gardenia*) and of other plants. This classification applies more especially to Chinese teas. Tea became known in Europe during the seventeenth century. Among western nations the greatest consumers of tea are Great Britain, Russia, and the United States.

2. The tea-plant, *Thea Sinensis*. It is a shrub from 3 to 6 feet high, with leaves from 4 to 8 inches long and from 1½ to 2½ inches broad, and tapering toward both ends; the flowers are white, and about 1½ inches broad. The cultivated plant is of a more contracted habit, with smaller, more obtuse, and leathery leaves. The plant is known to grow wild in upper Assam, the form there found having sometimes been distinguished as *Thea Assamica*, forming, with its varieties, Assam tea. The Assam plant is much superior to the Chinese, and the teas most planted are hybrids of the two. The Chinese tea has two varieties, formerly distinguished as *Thea Bohea* and *T. viridis*, black and green tea; but either kind of tea can be made from either plant. China is the great seat of tea-culture; but tea is also extensively grown in Japan, having been introduced in the reign of Saga Tennō (A. D. 810–23), also in India and Java. Promising experiments have been made in Madagascar, Natal, Jamaica, etc. In the United States it can be grown successfully in the South and in California; but the cost of labor has thus far prevented its economic success.

3. An infusion of the prepared leaves of the tea-plant, used as a beverage, in Great Britain and America commonly with the addition of a little milk or sugar, or both, in continental Europe often with a little spirit, in Russia with lemon, and in China and neighboring countries without any admixture. Its action is stimulating and invigorating, and, owing to the presence of tannin, more or less astringent. Its main quality depends upon the alkaloid theïn; the leaf contains also volatile oils, which give it its fragrance, and some other substances. Excessive use, especially of green tea, affects the nervous system unfavorably. While tea contains but trifling nutriment, it is held to retard the waste of the tissues and diminish the need of food.

Tears, like saliva, are continually secreted in a certain quantity, which is speedily and copiously increased when the activity of the gland is excited either by mechanical stimulation or by mental emotion. Any passion, tender or violent, as joy, anger, etc., and especially pain or grief, may excite the flow of tears, which is also immediately provoked by pain, especially in the eye itself. The tears ordinarily flow unperceived through the lacrymal canal or nasal duct into the nose; when the supply is too copious they overflow the lids and trickle down the cheek. Tears consist of slightly saline water, having an alkaline reaction.

Sche whassched his Feet with hire *Teres*, and wyped hem with hire Heer. *Mandeville*, Travels, p. 57.

It is observed, for instance, that when a wine-glass partially filled with port wine is allowed to stand, the alcohol evaporates more rapidly than the water present with it; hence the latter tends to increase in proportion, and because of its higher surface-tension creeps up on the surface of the glass, dragging the other liquid with it, till drops are formed which roll down the sides again.

=**Syn. 3.** *Tease*, *Vex*, *Annoy*, *Molest*, *Badger*, *Pester*, *Bother*, *Worry*, *Plague*, *Torment*. All these words either may or must refer to repeated acts; they all suggest mental pain, but of degrees varying with the word or with the circumstances; all except *badger* and *molest* may be used reflexively, but with different degrees of appropriateness, *vex*, *worry*, and *torment* being the most common in such use; the agent may be a person, or, except with *badger*, it may be a creature, events, circumstances, etc.; it would be clearly figurative to use *tease* when the agent is not a person; all except *tease* are always used seriously. *Tease* is not a strong word, but has considerable breadth of use: a child may *tease* his mother for what he desires; there is a great deal of good-humored *teasing* of friends about their matrimonial intentions; a fly may *tease* a dog by continually waking him up. *Vex* is stronger, literally implying anger and figuratively applying to repeated attacks, etc., such as would produce an excitement as strong as anger. In Shakspere's "still-vex'd Bermoothes" (Tempest, i. 2. 229), the use of *vex* is somewhat poetic or archaic, as is the application of the word to the continued agitation of the sea. *Annoy* has a middle degree of strength between *tease* and *vex*; a feeling of *annoyance* is somewhat short of *vexation*. We may be *annoyed* by the persistence of flies, beggars, duns, suitors, picket-firing, etc. *Molest* is generally a stronger word in its expression of harm done or intended, including the sense of disturbing once or often: some wild animals will not *molest* those who do not *molest* them. The next four words have a homely force—*badger* being founded upon the baiting of a badger by dogs, and thus implying persistence, energy, and some rudeness; *pester* implying similar persistence and much small vexation; *bother* implying weariness and perhaps confusion of the mind; and *worry* implying actual fatigue and even exhaustion. *Plague* and *torment* are very strong by the figurative extension of their primary meaning, although they are often used by hyperbole for that which is intolerable only by constant return: as, a *tormenting* fly. See *exasperate* and *harass*.

See *tea*[1], 2.—**2.** A name of various myrtaceous and other plants, chiefly of the genera *Leptospermum* and *Melaleuca*, found in Australia, Tasmania, and New Zealand. See phrases below. Very abundant and conspicuous, especially in New Zealand, is *L. scoparium*, the broom tea-tree, known also as *tea-scrub*. It is an erect rigid shrub, or in the mountains prostrate, from 1 to 12 feet high, forming dense thickets, with leathery sharp-pointed foliage, covered for two months with abundant small white blossoms. Its wood, though small, is hard and useful for turning, etc. *L. lanigerum*, the Tasmanian tea-tree (found also in Australia), is a somewhat larger, very abundant shrub or tree, with a hard even-grained wood. The leaves of both are reputed to have been used by Captain Cook or early colonists as tea, which may account for the name, but the native Australian name of the former is *ti*. *Melaleuca uncinata*, the common tea-tree, is a shrub, or sometimes a tree from 40 to 80 feet high, with hard, heavy, durable wood, widely diffused in Australia.

Even the grass itself is not indigenous, all these hills [in New Zealand] having till recently been densely clothed with a thicket of *tea-tree*, which is a shrub somewhat resembling Juniper or a gigantic heather-bush, its foliage consisting of tiny needles, while its delicate white blossoms resemble myrtle. It is called by the Maoris manakau, but the settlers have a tradition that Captain Cook and his men once made tea of its twigs; hence, they say, the name. It is, however, noteworthy that this plant is called *ti* by the Australian blacks, so it is probable that the name was brought thither by some colonist from the sister isle.
C. F. G. Cumming, in The Century, XXVII. 920.

The Te Deum is first mentioned early in the sixth century. Its authorship is popularly attributed to St. Ambrose and St. Augustine, but it probably assumed nearly its present form in the fourth century, during the Arian and Macedonian controversies, though in substance it seems to be still older. St. Cyprian in A. D. 252 using words closely similar to the seventh, eighth, and ninth verses, and several of the latter verses ("Day by day," etc.) agreeing with part of an ancient Greek hymn, preserved in the Alexandrian Codex, the beginning of which is a form of the Gloria in Excelsis. Originally it was obviously modeled on the preface and great intercession of a primitive liturgy, probably African, of the type of the liturgy of St. James (see *liturgy*). In the Roman Catholic hour-offices the Te Deum is sung at the close of matins on Sundays and feast-days, but not in Advent nor from Septuagesima to Easter, except on feasts, and also in the ferial office from Easter to Pentecost. In the Anglican morning prayer, condensed from the Sarum matins, lauds, and prime, the Te Deum marks the close of matins. The Benedicite, taken from lauds, is used as its alternate, and in many churches the Te Deum is not sung in Advent or Lent. Also, more fully, *Te Deum Laudamus.*

God fought for us. . . . Do we all holy rites;
Let there be sung "Non nobis" and "*Te Deum.*"
